

# Non-regular languages

(Pumping Lemma)

- Introduction

**Non Regular language**

**How can we prove that a language is not regular?**

Non-regular languages

$$\{a^n b^n : n \geq 0\}$$

$$\{vv^R : v \in \{a,b\}^*\}$$

Regular languages

$$a^*b$$

$$b^*c + a$$

$$b + c(a + b)^*$$

*etc...*

How can we prove that a language  $L$  is not regular?

Prove that there is no DFA or NFA or RE that accepts  $L$

**Difficulty:** this is not easy to prove  
(since there is an infinite number of them)

**Solution:** use the Pumping Lemma !!!

# The Pigeonhole Principle

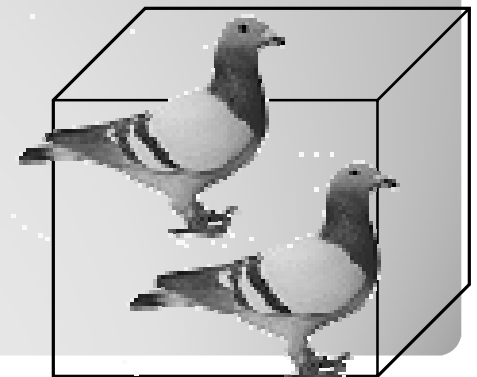

4 pigeons

3 pigeonholes

A pigeonhole must contain at least two pigeons

$n$  pigeons

$m$  pigeonholes

$n > m$

# The Pigeonhole Principle

$n$  pigeons

$m$  pigeonholes

$$n > m$$

There is a pigeonhole  
with at least 2 pigeons

.....

# The Pigeonhole Principle

and

DFAs

Consider a DFA with 4 states

Consider the walk of a "long" string:  $aaaaab$   
(length at least 4)

A state is repeated in the walk of  $aaaaab$

The state is repeated as a result of the pigeonhole principle

Walk of  $aaaab$

Pigeons:  
(walk states)

Are more than

Nests:  
(Automaton states)

Repeated  
state

Consider the walk of a "long" string:  $aabb$   
(length at least 4)

Due to the pigeonhole principle:

A state is repeated in the walk of  $aabb$

The state is repeated as a result of the pigeonhole principle

Walk of  $aabb$

Pigeons:  
(walk states)

Are more than

Nests:  
(Automaton states)

Automaton States

Repeated state

In General: If  $|w| \geq \# \text{states of DFA}$ ,  
 by the pigeonhole principle,  
 a state is repeated in the walk  $w$

Walk of  $w = \sigma_1\sigma_2 \cdots \sigma_k$

Arbitrary DFA

Repeated state

$$|w| \geq \# \text{states of DFA} = m$$

Pigeons: (walk states)

Walk of  $w$

Are  
more  
than

Nests: (Automaton states)

A state is  
repeated

# The Pumping Lemma

Take an **infinite** regular language  $L$   
(contains an infinite number of strings)

There exists a DFA that accepts  $L$

Take string  $w \in L$  with  $|w| \geq m$

(number of  
states of DFA)

then, at least one state is repeated  
in the walk of  $w$

Walk in DFA of

$$w = \sigma_1 \sigma_2 \cdots \sigma_k$$

Repeated state in DFA

There could be many states repeated

Take  $q$  to be the first state repeated

One dimensional projection of walk  $w$  :

We can write  $w = xyz$

One dimensional projection of walk  $w$  :

First

Second

occurrence

occurrence

$$x = \sigma_1 \cdots \sigma_i$$

$$y = \sigma_{i+1} \cdots \sigma_j$$

$$z = \sigma_{j+1} \cdots \sigma_k$$

In DFA:  $w = x y z$

contains only  
first occurrence of  $q$

Observation: length  $|xy| \leq m$  number of states of DFA

Unique States

Since, in  $xy$  no state is repeated

(except  $q$ )

Observation:  $\text{length } |y| \geq 1$

Since there is at least one transition in loop

We do not care about the form of string  $z$ .

$z$  may actually overlap with the paths of  $x$  and  $y$

Additional string: The string  $xz$   
is accepted

Do not follow loop

Additional string: The string  $x y y z$   
is accepted

Follow loop  
2 times

Additional string:

The string  $x y y y z$   
is accepted

Follow loop  
3 times

In General: The string  $x y^i z$   
is accepted  $i = 0, 1, 2, \dots$

Follow loop  
 $i$  times

Therefore:  $x y^i z \in L \quad i = 0, 1, 2, \dots$

Language accepted by the DFA

In other words, we described:

The Pumping Lemma !!!

## The Pumping Lemma:

- Given a infinite regular language  $L$
- there exists an integer  $m$  (critical length)
- for any string  $w \in L$  with length  $|w| \geq m$
- we can write  $w = x y z$
- with  $|x y| \leq m$  and  $|y| \geq 1$
- such that:  $x y^i z \in L \quad i = 0, 1, 2, \dots$

In the book:

Critical length  $m$  = Pumping length  $p$

# Applications of the Pumping Lemma

## Observation:

- Every language of finite size has to be regular  
(we can easily construct an NFA  
that accepts every string in the language)

Therefore, every non-regular language  
has to be of infinite size  
(contains an infinite number of strings)

Suppose you want to prove that

An infinite language  $L$  is not regular

1. Assume the opposite:  $L$  is regular
2. The pumping lemma should hold for  $L$
3. Use the pumping lemma to obtain a contradiction
4. Therefore,  $L$  is not regular

## Explanation of Step 3: How to get a contradiction

1. Let  $m$  be the critical length for  $L$
2. Choose a particular string  $w \in L$  which satisfies the length condition  $|w| \geq m$
3. Write  $w = xyz$
4. Show that  $w' = xy^i z \notin L$  for some  $i \neq 1$
5. This gives a contradiction, since from pumping lemma  $w' = xy^i z \in L$

Note: It suffices to show that only one string  $w \in L$  gives a contradiction

You don't need to obtain contradiction for every  $w \in L$

## Example of Pumping Lemma application

**Theorem:** The language  $L = \{a^n b^n : n \geq 0\}$   
is not regular

**Proof:** Use the Pumping Lemma

$$L = \{a^n b^n : n \geq 0\}$$

Assume for contradiction  
that  $L$  is a regular language

Since  $L$  is infinite  
we can apply the Pumping Lemma

$$L = \{a^n b^n : n \geq 0\}$$

Let  $m$  be the critical length for  $L$

Pick a string  $w$  such that:  $w \in L$

and length  $|w| \geq m$

We pick  $w = a^m b^m$

From the Pumping Lemma:

we can write  $w = a^m b^m = x y z$

with lengths  $|x y| \leq m, |y| \geq 1$

$$w = xyz = a^m b^m = \underbrace{a \dots a}_{x} \underbrace{a \dots a}_{y} \underbrace{a \dots a b \dots b}_{z}$$

The diagram shows the decomposition of  $w = a^m b^m$  into  $xyz$ . The string  $a^m b^m$  is represented as  $a \dots a a \dots a a \dots a b \dots b$ . A green bracket above the string indicates that the total length of the  $a$  segment is  $m$  and the total length of the  $b$  segment is  $m$ . Red brackets below the string indicate the decomposition into  $x$ ,  $y$ , and  $z$ .  $x$  is a substring of the  $a$ 's,  $y$  is a substring of the  $a$ 's, and  $z$  contains the remaining  $a$ 's and all  $b$ 's.

**Thus:**  $y = a^k, 1 \leq k \leq m$

$$x y z = a^m b^m \quad y = a^k, \quad 1 \leq k \leq m$$

From the Pumping Lemma:  $x y^i z \in L$

$$i = 0, 1, 2, \dots$$

**Thus:**  $x y^2 z \in L$

$$x y z = a^m b^m \quad y = a^k, \quad 1 \leq k \leq m$$

From the Pumping Lemma:  $x y^2 z \in L$

$$xy^2z = \overbrace{a \dots a a \dots a a \dots a a \dots a}^{m+k} \overbrace{b \dots b}^m \in L$$

$x \quad y \quad y \quad z$

**Thus:**  $a^{m+k} b^m \in L$

$$a^{m+k}b^m \in L \quad k \geq 1$$

**BUT:**  $L = \{a^n b^n : n \geq 0\}$

$$a^{m+k}b^m \notin L$$

**CONTRADICTION!!!**

Therefore: Our assumption that  $L$   
is a regular language is not true

**Conclusion:**  $L$  is not a regular language

END OF PROOF

Non-regular language  $\{a^n b^n : n \geq 0\}$

Regular languages

$L(a^* b^*)$
