Addressing Modes and Instruction of 8086

Addressing Modes

- 1. Implied Addressing The data value/data address is implicitly associated with the instruction
- 2. Register Addressing The data is specified by referring the register or the register pair in which the data is present
- 3.Immediate Addressing The data itself is provided in the instruction
- 4.Direct Addressing The instruction operand specifies the memory address where data is located

Addressing Modes

- 5.Register indirect addressing The instruction specifies a register containing an address, where data is located
- Based 8-bit or 16-bit instruction operand is added to the contents of a base register (BX or BP), the resulting value is a pointer to location where data resides
- Indexed 8-bit or 16-bit instruction operand is added to the contents of an index register (SI or DI), the resulting value is a pointer to location where data resides

Addressing Modes

- 6.Based Indexed the contents of a base register (BX or BP) is added to the contents of an index register (SI or DI), the resulting value is a pointer to location where data resides
- ▶ 7.Based Indexed with displacement 8-bit or 16-bit instruction operand is added to the contents of a base register (BX or BP) and index register (SI or DI), the resulting value is a pointer to location where data resides
