

PRINCIPLES OF OPERATING SYSTEMS

OPERATING SYSTEM

LECTURE-1 INTRODUCTION

Introduction

- ⌘ What is an operating system?
- ⌘ Early Operating Systems
 - ⊞ Simple Batch Systems
 - ⊞ Multiprogrammed Batch Systems
- ⌘ Time-sharing Systems
- ⌘ Personal Computer Systems
- ⌘ Parallel and Distributed Systems
- ⌘ Real-time Systems

Computer System Architecture

What is an Operating System?

- ⌘ An OS is a program that acts an intermediary between the user of a computer and computer hardware.
- ⌘ Major cost of general purpose computing is software.
 - ⊞ OS simplifies and manages the complexity of running application programs efficiently.

Goals of an Operating System

- ⌘ Simplify the execution of user programs and make solving user problems easier.
- ⌘ Use computer hardware efficiently.
 - ☒ Allow sharing of hardware and software resources.
- ⌘ Make application software portable and versatile.
- ⌘ Provide isolation, security and protection among user programs.
- ⌘ Improve overall system reliability
 - ☒ error confinement, fault tolerance, reconfiguration.

Why should I study Operating Systems?

- ⊞ Need to understand interaction between the hardware and applications
 - ⊗ New applications, new hardware..
 - ⊗ Inherent aspect of society today
- ⊞ Need to understand basic principles in the design of computer systems
 - ⊗ efficient resource management, security, flexibility
- ⊞ Increasing need for specialized operating systems
 - ⊗ e.g. embedded operating systems for devices - cell phones, sensors and controllers
 - ⊗ real-time operating systems - aircraft control, multimedia services

Systems Today

OnStar by GM

Front Sensors

Cellular Antenna

Sensing Diagnostic Module (SDM)

Side Sensors

OnStar Module

The image shows a call center agent on the left wearing a headset. In the center is a car stereo displaying "INFLUENT BLVD 25 yard R2T (Pass/Cancel)". On the right, a silver SUV is shown with various sensor locations marked: Front Sensors, Cellular Antenna, Sensing Diagnostic Module (SDM), Side Sensors, and OnStar Module. A satellite is visible in the sky above the car.

Loop sensors

RFID reader

Motes

Long-short range 802.11a

Mesh routers

Indoor cameras

Outdoor cameras

Mobile cameras

People counters

Evacpack

Mobile sensing cars

Mobile sensing devices

An aerial view of a city with various smart infrastructure components labeled. The labels include: Loop sensors, RFID reader, Motes, Long-short range 802.11a, Mesh routers, Indoor cameras, Outdoor cameras, Mobile cameras, People counters, Evacpack, Mobile sensing cars, and Mobile sensing devices. The city is shown with roads, buildings, and green spaces.

The Smart Grid Can Deliver

Market

PHV

BENEFITS

- Reduced energy costs
- Reduced greenhouse gases
- Improved power quality
- Increased power system reliability

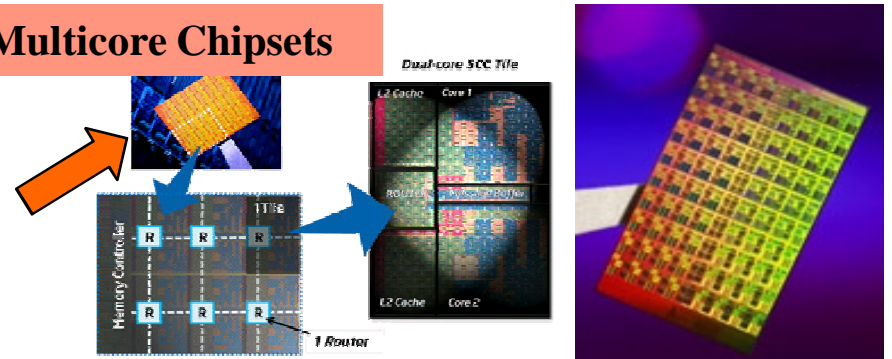

The image shows a smart grid system with power lines, a house with solar panels, and a car. A large power cord is on the right. A "Market" icon is shown, and a "PHV" (Plug-in Hybrid Vehicle) icon is also present. A bar chart is visible at the bottom right. The text "The Smart Grid Can Deliver" is at the top.

Hardware Complexity Increases

Moore's Law: 2X
transistors/Chip Every 1.5 years

Intel Multicore Chipsets

Software Complexity Increases

Computer System Components

⌘ Hardware

- ☒ Provides basic computing resources (CPU, memory, I/O devices).

⌘ Operating System

- ☒ Controls and coordinates the use of hardware among application programs.

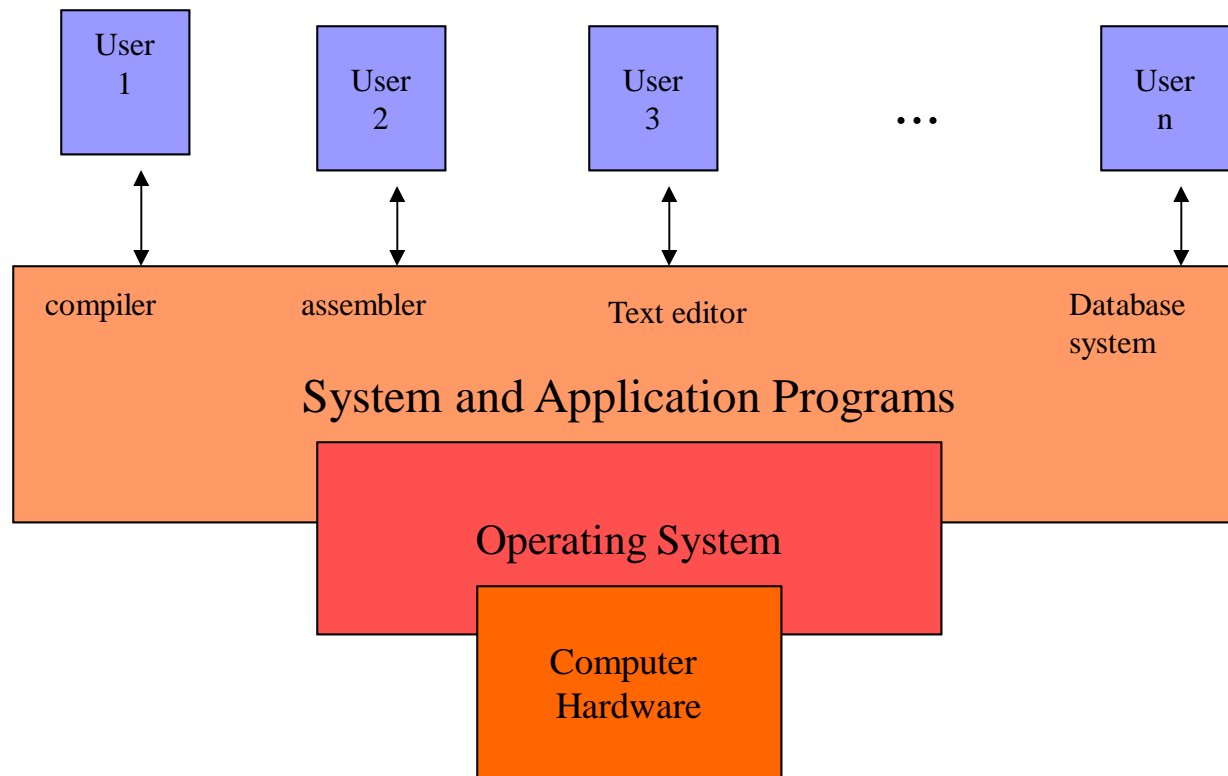

⌘ Application Programs

- ☒ Solve computing problems of users (compilers, database systems, video games, business programs such as banking software).

⌘ Users

- ☒ People, machines, other computers

Abstract View of System

Operating System Views

⌘ Resource allocator

- ⊗ to allocate resources (software and hardware) of the computer system and manage them efficiently.

⌘ Control program

- ⊗ Controls execution of user programs and operation of I/O devices.

⌘ Kernel

- ⊗ The program that executes forever (everything else is an application with respect to the kernel).

Operating System Spectrum

⌘ Monitors and Small Kernels

⊗ special purpose and embedded systems, real-time systems

⌘ Batch and multiprogramming

⌘ Timesharing

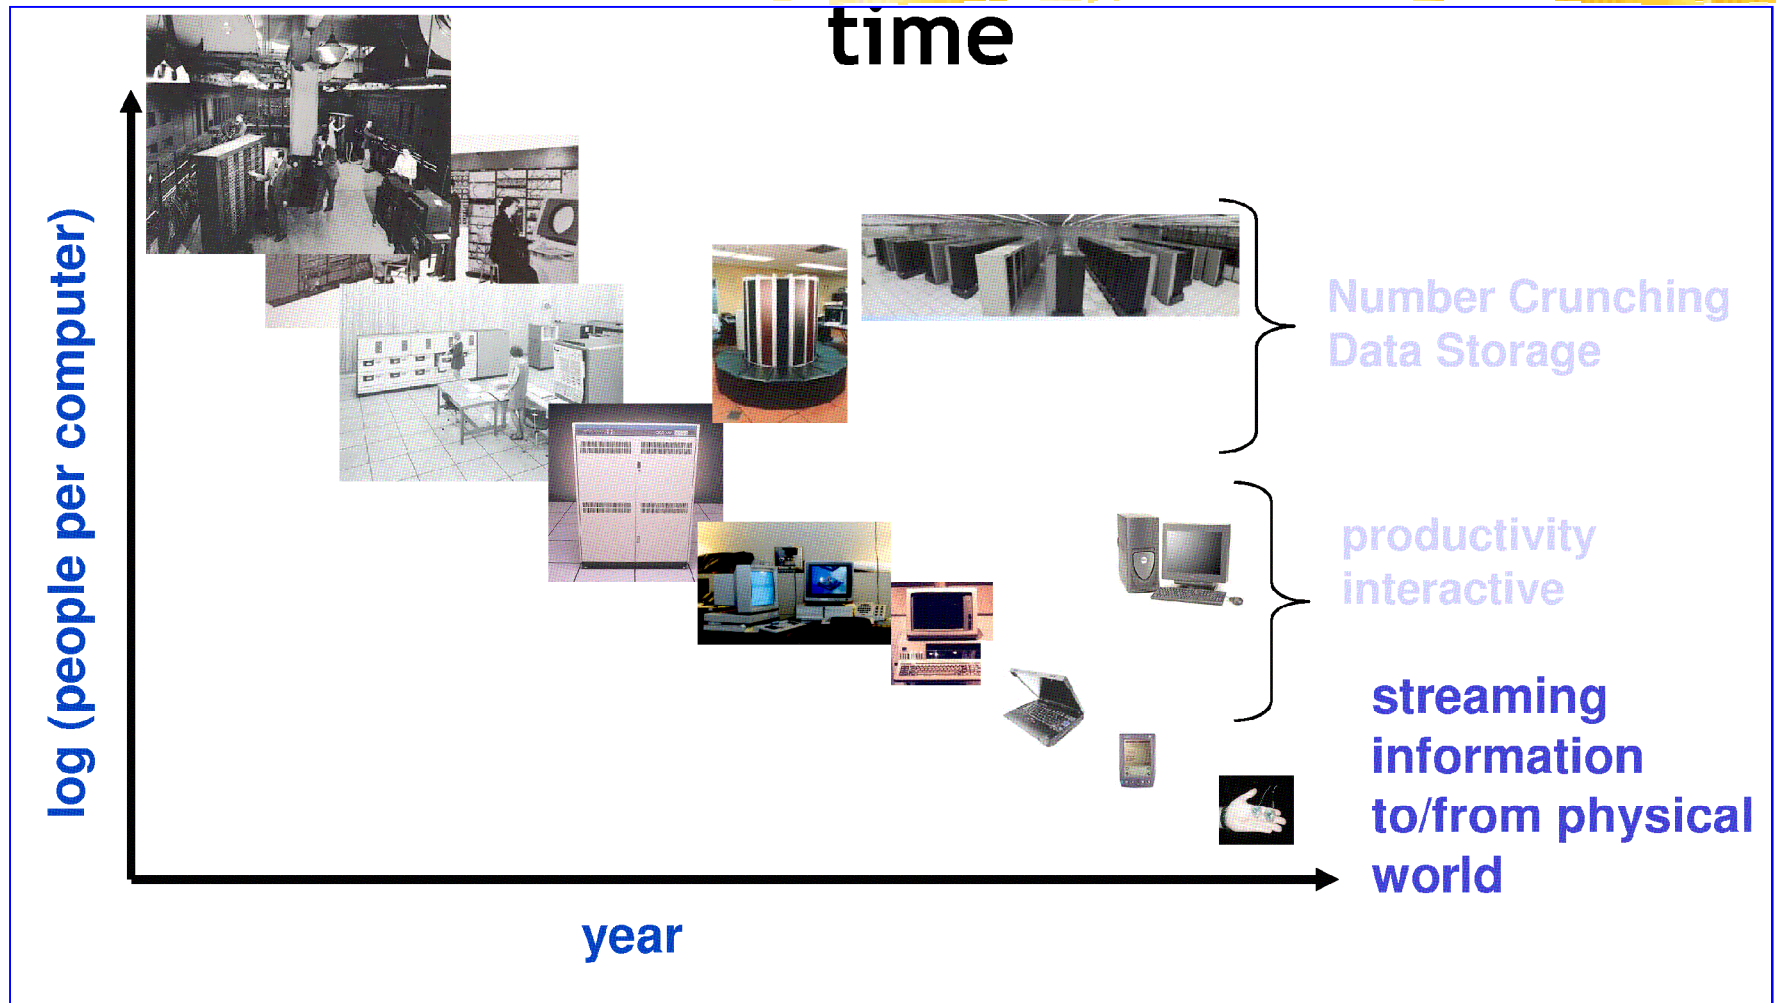

⊗ workstations, servers, minicomputers, timeframes

⌘ Transaction systems

⌘ Personal Computing Systems

⌘ Mobile Platforms, devices (of all sizes)

People-to-Computer Ratio Over Time

Early Systems - Bare Machine (1950s)

Hardware – *expensive* ; Human – *cheap*

⌘ Structure

- ⊗ Large machines run from console
- ⊗ Single user system
 - Programmer/User as operator
- ⊗ Paper tape or punched cards

⌘ Early software

- ⊗ Assemblers, compilers, linkers, loaders, device drivers, libraries of common subroutines.

⌘ Secure execution

⌘ Inefficient use of expensive resources

- ⊗ Low CPU utilization, high setup time.

Simple Batch Systems (1960's)

- ⌘ Reduce setup time by batching jobs with similar requirements.
- ⌘ Add a card reader, Hire an operator
 - ☒ User is NOT the operator
 - ☒ Automatic job sequencing
 - ☒ Forms a rudimentary OS.
 - ☒ Resident Monitor
 - ☒ Holds initial control, control transfers to job and then back to monitor.
 - ☒ Problem
 - ☒ Need to distinguish job from job and data from program.

Supervisor/Operator Control

☒ Secure monitor that controls job processing

- ☒ Special cards indicate what to do.
- ☒ User program prevented from performing I/O

☒ Separate user from computer

- ☒ User submits card deck
- ☒ cards put on tape
- ☒ tape processed by operator
- ☒ output written to tape
- ☒ tape printed on printer

☒ Problems

- ☒ Long turnaround time - up to 2 DAYS!!!
- ☒ Low CPU utilization
 - I/O and CPU could not overlap; slow mechanical devices.

Batch Systems - Issues

⊞ Solutions to speed up I/O:

⊞ Offline Processing

- ⊞ load jobs into memory from tapes, card reading and line printing are done offline.

⊞ Spooling

- ⊞ Use disk (random access device) as large storage for reading as many input files as possible and storing output files until output devices are ready to accept them.
- ⊞ Allows overlap - I/O of one job with computation of another.
- ⊞ Introduces notion of a job pool that allows OS choose next job to run so as to increase CPU utilization.

Speeding up I/O

Batch Systems - I/O completion

⌘ How do we know that I/O is complete?

⊞ Polling:

- ⊞ Device sets a flag when it is busy.
- ⊞ Program tests the flag in a loop waiting for completion of I/O.

⊞ Interrupts:

- ⊞ On completion of I/O, device forces CPU to jump to a specific instruction address that contains the interrupt service routine.
- ⊞ After the interrupt has been processed, CPU returns to code it was executing prior to servicing the interrupt.

Summary of lecture

- ⌘ What is an operating system?
- ⌘ Early Operating Systems
- ⌘ Simple Batch Systems
