

**Course Name:**  
**Database Management**  
**Systems**

# Lecture 9

## Topics to be covered

- ❑ Relational Algebra and Operations

# Relational Algebra

- Basic operations:

- Selection ( $\sigma$ ) Selects a subset of rows from relation.
- Projection ( $\pi$ ) Deletes unwanted columns from relation.
- Cross-product ( $\times$ ) Allows us to combine two relations.
- Set-difference ( $-$ ) Tuples in reln. 1, but not in reln. 2.
- Union ( $\cup$ ) Tuples in reln. 1 and in reln. 2.

- Additional operations:

- Intersection, join, division, renaming: Not essential, but (very!) useful.

- Since each operation returns a relation, **operations can be composed!** (Algebra is “closed”.)

# Projection

- Deletes attributes that are not in *projection list*.
- **Schema** of result contains exactly the fields in the projection list, with the same names that they had in the (only) input relation.
- Projection operator has to eliminate **duplicates!** (Why??)
  - Note: real systems typically don't do duplicate elimination unless the user explicitly asks for it. (Why not?)

sname	rating
yuppy	9
lubber	8
guppy	5
rusty	10

$\pi_{sname, rating}(S2)$

age
35.0
55.5

$\pi_{age}(S2)$

# Selection

sid	sname	rating	age
28	yuppy	9	35.0
58	rusty	10	35.0

- Selects rows that satisfy *selection condition*.
- No duplicates in result! (Why?)
- *Schema* of result identical to schema of (only) input relation.
- *Result* relation can be the *input* for another relational algebra operation! (*Operator composition*.)

$$\sigma_{rating > 8}(S2)$$

sname	rating
yuppy	9
rusty	10

$$\pi_{sname, rating}(\sigma_{rating > 8}(S2))$$

# Union, Intersection, Set-Difference

sid	sname	rating	age
22	dustin	7	45.0
31	lubber	8	55.5
58	rusty	10	35.0
44	guppy	5	35.0
28	yuppy	9	35.0

- All of these operations take two input relations, which must be union-compatible:
  - Same number of fields.
  - `Corresponding' fields have the same type.

$S1 \cup S2$

sid	sname	rating	age
22	dustin	7	45.0

$S1 - S2$

sid	sname	rating	age
31	lubber	8	55.5
58	rusty	10	35.0

$S1 \cap S2$

# Cross-Product

- Each row of S1 is paired with each row of R1.
- Result schema** has one field per field of S1 and R1, with field names 'inherited' if possible.
- Conflict:** Both S1 and R1 have a field called *sid*.

(sid)	sname	rating	age	(sid)	bid	day
22	dustin	7	45.0	22	101	10/10/96
22	dustin	7	45.0	58	103	11/12/96
31	lubber	8	55.5	22	101	10/10/96
31	lubber	8	55.5	58	103	11/12/96
58	rusty	10	35.0	22	101	10/10/96
58	rusty	10	35.0	58	103	11/12/96

- Renaming operator:**  $\rho (C(1 \rightarrow sid1, 5 \rightarrow sid2), S1 \times R1)$

# Joins

$$R \bowtie_c S = \sigma_c (R \times S)$$

- Condition Join:

(sid)	sname	rating	age	(sid)	bid	day
22	dustin	7	45.0	58	103	11/12/96
31	lubber	8	55.5	58	103	11/12/96

$$S1 \bowtie_{S1.sid < R1.sid} R1$$

- **Result schema** same as that of cross-product.
- Fewer tuples than cross-product, might be able to compute more efficiently
- Sometimes called a **theta-join**.

# Joins

- Equi-Join: A special case of condition join where the condition  $c$  contains only ***equalities***.

sid	sname	rating	age	bid	day
22	dustin	7	45.0	101	10/10/96
58	rusty	10	35.0	103	11/12/96

$$S1 \bowtie_{sid} R1$$

- Result schema similar to cross-product, but only one copy of fields for which equality is specified.
- Natural Join: Equijoin on *all* common fields.

# Division

- Not supported as a primitive operator, but useful for expressing queries like:

*Find sailors who have reserved **all** boats.*

- Let  $A$  have 2 fields,  $x$  and  $y$ ;  $B$  have only field  $y$ :

- $A/B = \{ \langle x \rangle \mid \exists \langle x, y \rangle \in A \ \forall \langle y \rangle \in B \}$

- i.e.,  **$A/B$  contains all  $x$  tuples (sailors) such that for every  $y$  tuple (boat) in  $B$ , there is an  $xy$  tuple in  $A$ .**

- Or: If the set of  $y$  values (boats) associated with an  $x$  value (sailor) in  $A$  contains all  $y$  values in  $B$ , the  $x$  value is in  $A/B$ .

- In general,  $x$  and  $y$  can be any lists of fields;  $y$  is the list of fields in  $B$ , and  $x \cup y$  is the list of fields of  $A$ .

# Expressing A/B Using Basic Operators

- Division is not essential op; just a useful shorthand.
  - (Also true of joins, but joins are so common that systems implement joins specially.)
- **Idea:** For  $A/B$ , compute all  $x$  values that are not 'disqualified' by some  $y$  value in  $B$ .
  - $x$  value is *disqualified* if by attaching  $y$  value from  $B$ , we obtain an  $xy$  tuple that is not in  $A$ .

Disqualified  $x$  values:  $\pi_x ((\pi_x(A) \times B) - A)$

$A/B$ :  $\pi_x(A) -$  all disqualified tuples

# Find names of sailors who've reserved boat #103

$$\pi_{sname}((\sigma_{bid=103} Reserves) \bowtie Sailors)$$

❖ Solution 2:  $\rho(Temp1, \sigma_{bid=103} Reserves)$

$$\rho(Temp2, Temp1 \bowtie Sailors)$$

● Solution 1:

$$\pi_{sname}(Temp2)$$

❖ Solution 3:  $\pi_{sname}(\sigma_{bid=103}(Reserves \bowtie Sailors))$

Find names of sailors who've reserved a red boat

$\pi_{sname}((\sigma_{color='red'} Boats) \bowtie Reserves \bowtie Sailors)$

❖ A more efficient solution:

- Information about boat color only available in Boats; so need an extra join:

$\pi_{sname}(\pi_{sid}((\pi_{bid} \sigma_{color='red'} Boats) \bowtie Res) \bowtie Sailors)$

*A query optimizer can find this, given the first solution!*

# Find sailors who've reserved a red or a green boat

$\rho$  (*Tempboats*, ( $\sigma_{color='red' \vee color='green'}$  *Boats*))

$\pi_{sname}$  (*Tempboats*  $\bowtie$  *Reserves*  $\bowtie$  *Sailors*)

- Can identify all red or green boats, then find sailors who've reserved one of these boats:
- ❖ Can also define *Tempboats* using union! (How?)
- ❖ What happens if  $\vee$  is replaced by  $\wedge$  in this query?

# Find sailors who've reserved a red and a green boat

- Previous approach won't work! Must identify sailors who've reserved red boats, sailors who've reserved green boats, then find the intersection (note that *sid* is a key for *Sailors*):

$$\rho (Tempred, \pi_{sid} ((\sigma_{color='red'} Boats) \bowtie Reserves))$$
$$\rho (Tempgreen, \pi_{sid} ((\sigma_{color='green'} Boats) \bowtie Reserves))$$
$$\pi_{sname} ((Tempred \cap Tempgreen) \bowtie Sailors)$$
