

**Course Name:**  
**Database Management**  
**Systems**

# Lecture 22

## Topics to be covered

### □ Serializability

- *Introduction*
- *Conflict Serializability*
- *View Serializability*
- *Testing for Serializability*
- *Applications*
- *Scope of Research*

# Introduction

- **Basic Assumption** – Each transaction preserves database consistency.
- Thus serial execution of a set of transactions preserves database consistency.
- A (possibly concurrent) schedule is serializable if it is equivalent to a serial schedule. Different forms of schedule equivalence give rise to the notions of:
  1. **conflict serializability**
  2. **view serializability**
- *Simplified view of transactions*
  - We ignore operations other than **read** and **write** instructions
  - We assume that transactions may perform arbitrary computations on data in local buffers in between reads and writes.
  - Our simplified schedules consist of only **read** and **write** instructions.

# Conflicting Instructions

- Instructions  $l_i$  and  $l_j$  of transactions  $T_i$  and  $T_j$  respectively, **conflict** if and only if there exists some item  $Q$  accessed by both  $l_i$  and  $l_j$ , and at least one of these instructions wrote  $Q$ .
  1.  $l_i = \mathbf{read}(Q)$ ,  $l_j = \mathbf{read}(Q)$ .  $l_i$  and  $l_j$  don't conflict.
  2.  $l_i = \mathbf{read}(Q)$ ,  $l_j = \mathbf{write}(Q)$ . They conflict.
  3.  $l_i = \mathbf{write}(Q)$ ,  $l_j = \mathbf{read}(Q)$ . They conflict
  4.  $l_i = \mathbf{write}(Q)$ ,  $l_j = \mathbf{write}(Q)$ . They conflict
- Intuitively, a conflict between  $l_i$  and  $l_j$  forces a (logical) temporal order between them.
  - If  $l_i$  and  $l_j$  are consecutive in a schedule and they do not conflict, their results would remain the same even if they had been interchanged in the schedule.

# Conflict Serializability

- If a schedule  $S$  can be transformed into a schedule  $S'$  by a series of swaps of non-conflicting instructions, we say that  $S$  and  $S'$  are **conflict equivalent**.
- We say that a schedule  $S$  is **conflict serializable** if it is conflict equivalent to a serial schedule

# Conflict Serializability (Cont.)

- Schedule 3 can be transformed into Schedule 6, a serial schedule where  $T_2$  follows  $T_1$ , by series of swaps of non-conflicting instructions.
- Therefore Schedule 3 is conflict serializable.

$T_1$	$T_2$
read(A) write(A)	read(A) write(A)
read(B) write(B)	read(B) write(B)

Schedule 3

$T_1$	$T_2$
read(A) write(A) read(B) write(B)	read(A) write(A) read(B) write(B)

Schedule 6

# Conflict Serializability (Cont.)

- Example of a schedule that is not conflict serializable:

$T_3$	$T_4$
read( $Q$ )	write( $Q$ )
write( $Q$ )	

- We are unable to swap instructions in the above schedule to obtain either the serial schedule  $\langle T_3, T_4 \rangle$ , or the serial schedule  $\langle T_4, T_3 \rangle$ .

# View Serializability

- Let  $S$  and  $S'$  be two schedules with the same set of transactions.  $S$  and  $S'$  are **view equivalent** if the following three conditions are met, for each data item  $Q$ ,
  1. If in schedule  $S$ , transaction  $T_i$  reads the initial value of  $Q$ , then in schedule  $S'$  also transaction  $T_i$  must read the initial value of  $Q$ .
  2. If in schedule  $S$  transaction  $T_i$  executes **read**( $Q$ ), and that value was produced by transaction  $T_j$  (if any), then in schedule  $S'$  also transaction  $T_i$  must read the value of  $Q$  that was produced by the same **write**( $Q$ ) operation of transaction  $T_j$ .
  3. The transaction (if any) that performs the final **write**( $Q$ ) operation in schedule  $S$  must also perform the final **write**( $Q$ ) operation in schedule  $S'$ .

As can be seen, view equivalence is also based purely on **reads** and **writes** alone.

# View Serializability (Cont.)

- A schedule  $S$  is **view serializable** if it is view equivalent to a serial schedule.
- Every conflict serializable schedule is also view serializable.
- Below is a schedule which is view-serializable but *not* conflict serializable.

$T_3$	$T_4$	$T_6$
read( $Q$ )	write( $Q$ )	
write( $Q$ )		
		write( $Q$ )

- What serial schedule is above equivalent to?
- Every view serializable schedule that is not conflict serializable has **blind writes**.

# Other Notions of Serializability

- The schedule below produces same outcome as the serial schedule  $\langle T_1, T_5 \rangle$ , yet is not conflict equivalent or view equivalent to it.

$T_1$	$T_5$
read(A) $A := A - 50$ write(A)	
	read(B) $B := B - 10$ write(B)
read(B) $B := B + 50$ write(B)	
	read(A) $A := A + 10$ write(A)

- Determining such equivalence requires analysis of operations other than read and write.

# Testing for Serializability

- Consider some schedule of a set of transactions  $T_1, T_2, \dots, T_n$
- **Precedence graph** — a direct graph where the vertices are the transactions (names).
- We draw an arc from  $T_i$  to  $T_j$  if the two transaction conflict, and  $T_i$  accessed the data item on which the conflict arose earlier.
- We may label the arc by the item that was accessed.
- **Example 1**

# Example Schedule (Schedule A) + Precedence Graph

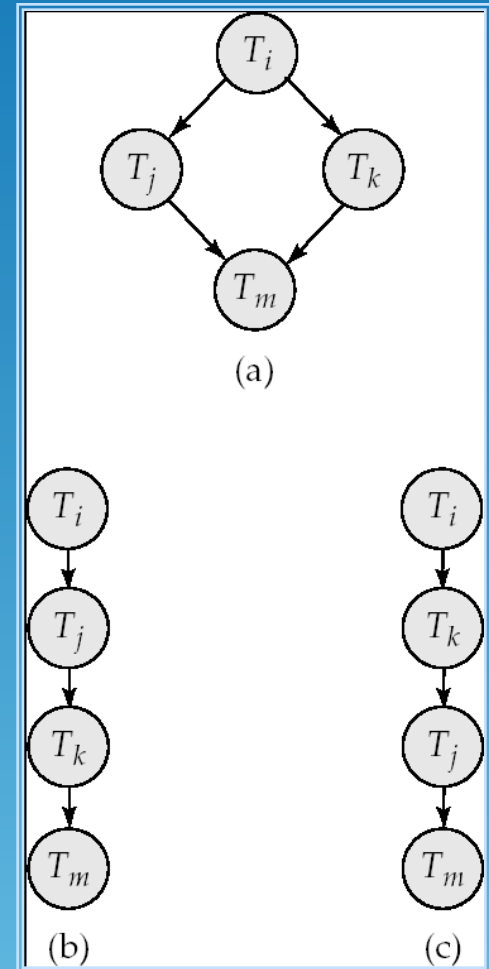

$T_1$	$T_2$	$T_3$	$T_4$	$T_5$
read(Y) read(Z)	read(X)			
read(U)	read(Y) write(Y)	write(Z)		read(V) read(W) read(W)
read(U) write(U)			read(Y) write(Y) read(Z) write(Z)	

$T_5$

# Test for Conflict Serializability

- A schedule is conflict serializable if and only if its precedence graph is acyclic.
- Cycle-detection algorithms exist which take order  $n^2$  time, where  $n$  is the number of vertices in the graph.
  - (Better algorithms take order  $n + e$  where  $e$  is the number of edges.)
- If precedence graph is acyclic, the serializability order can be obtained by a *topological sorting* of the graph.
  - This is a linear order consistent with the partial order of the graph.
  - For example, a serializability order for Schedule A would be  $T_5 \rightarrow T_1 \rightarrow T_3 \rightarrow T_2 \rightarrow T_4$ 
    - Are there others?

# Test for View Serializability

- The precedence graph test for conflict serializability cannot be used directly to test for view serializability.
  - Extension to test for view serializability has cost exponential in the size of the precedence graph.
- The problem of checking if a schedule is view serializable falls in the class of *NP*-complete problems.
  - Thus existence of an efficient algorithm is *extremely* unlikely.
- However practical algorithms that just check some **sufficient conditions** for view serializability can still be used.

# Recoverable Schedules

Need to address the effect of transaction failures on concurrently running transactions.

- **Recoverable schedule** — if a transaction  $T_j$  reads a data item previously written by a transaction  $T_i$ , then the commit operation of  $T_i$  appears before the commit operation of  $T_j$ .
- The following schedule (Schedule 11) is not recoverable if  $T_9$  commits immediately after the read

$T_8$	$T_9$
read(A)	
write(A)	
	read(A)
read(B)	

- If  $T_8$  should abort,  $T_9$  would have read (and possibly shown to the user) an inconsistent database state. Hence, database must ensure that schedules are recoverable.

# Cascading Rollbacks

- **Cascading rollback** – a single transaction failure leads to a series of transaction rollbacks. Consider the following schedule where none of the transactions has yet committed (so the schedule is recoverable)

$T_{10}$	$T_{11}$	$T_{12}$
read( $A$ ) read( $B$ ) write( $A$ )	read( $A$ ) write( $A$ )	read( $A$ )

If  $T_{10}$  fails,  $T_{11}$  and  $T_{12}$  must also be rolled back.

- Can lead to the undoing of a significant amount of work

# Cascadeless Schedules

- **Cascadeless schedules** — cascading rollbacks cannot occur; for each pair of transactions  $T_i$  and  $T_j$  such that  $T_j$  reads a data item previously written by  $T_i$ , the commit operation of  $T_i$  appears before the read operation of  $T_j$ .
- Every cascadeless schedule is also recoverable
- It is desirable to restrict the schedules to those that are cascadeless

# Applications

- Serializability is the major correctness criterion for concurrent transactions' executions. It is considered the highest level of isolation between transactions, and plays an essential role in concurrency control. As such it is supported in all general purpose database systems. Strict and two phase (SS2PL) is a popular serializability mechanism utilized in most of the database systems (in various variants) since their early days.

# Scope of research

- Intrusion Detection and Containment in Database Systems
- Crime File management
- Mobile database research
- Computer Integrated Manufacturing
- Spatial databases
