Course Name: Analysis and Design of Algorithms

Topics to be covered

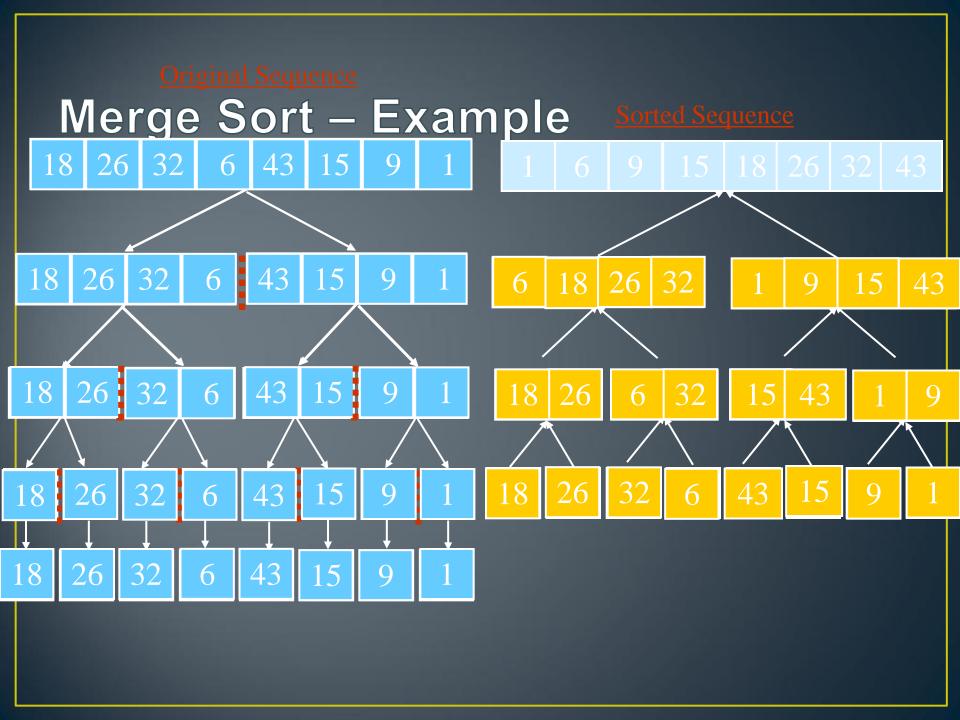

• Divide and Conquer - Merge Sort

Divide and Conquer Recursive in structure

- Divide the problem into sub-problems that are similar to the original but smaller in size
- Conquer the sub-problems by solving them recursively. If they are small enough, just solve them in a straightforward manner.
- Combine the solutions to create a solution to the original problem

An Example: Merge Sort Sorting Problem: Sort a sequence of *n* elements into non-decreasing order.

- Divide: Divide the *n*-element sequence to be sorted into two subsequences of *n*/2 elements each
- Conquer: Sort the two subsequences recursively using merge sort.
- Combine: Merge the two sorted subsequences to produce the sorted answer.

Merge-Sort (A, p, r)

INPUT: a sequence of *n* numbers stored in array Α

PUT an ordered sequence of *n* numbers

MergeSort (A, p, r) // sort A[p..r] by divide & conquer

if *p* < *r* 1

5

- then $q \leftarrow \lfloor (p+r)/2 \rfloor$ 2
- <u>MergeSort</u> (A, p, q)3 4
 - $\underline{MergeSort}(\overline{A, q+1, r})$
 - Merge (A, p, q, r) // merges A[p..q] with A[q+1..r]

Initial Call: MergeSort(A, 1, n)

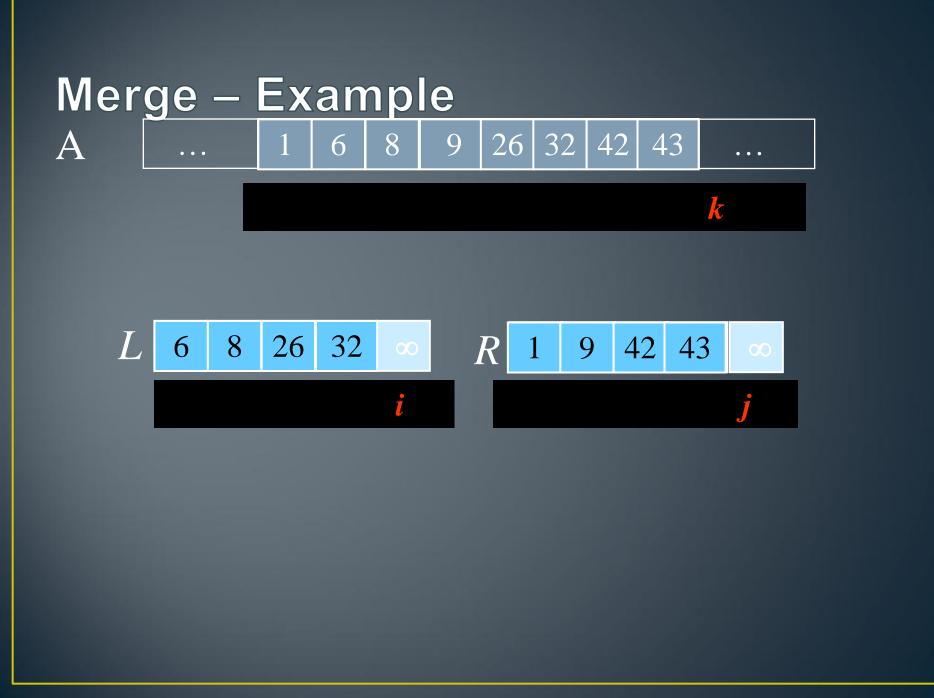

Procedure Merge

```
Merge(A, p, q, r)
    n_1 \leftarrow q - p + 1
   n_2 \leftarrow r - q
2
3
        for i \leftarrow 1 to n_1
             do L[i] \leftarrow A[p + i - 1]
4
5
      for j \leftarrow 1 to n_2
6
             do R[j] \leftarrow A[q + j]
7
         L[n_1+1] \leftarrow \infty
8
        R[n_2+1] \leftarrow \infty
9
         i \leftarrow 1
10
         j ← 1
         for k \leftarrow p to r^*
11
             do if L[i] \leq R[j]
12
                 then A[k] \leftarrow L[i]
13
14
                          i \leftarrow i + 1
                 else A[k] \leftarrow R[j]
15
16
                          j \leftarrow j + \uparrow
```

Input: Array containing sorted subarrays A[p..q]and A[q+1..r].

Output: Merged sorted subarray in A[p..r].

Sentinels, to avoid having to check if either subarray is fully copied at each step.

Correctness of Merge

Merge(*A*, *p*, *q*, *r*)

1 $n_1 \leftarrow q - p + 1$ 2 $n_2 \leftarrow r - q$ for $i \leftarrow 1$ to n_1 3 do $L[i] \leftarrow A[p+i-1]$ 4 5 for $j \leftarrow 1$ to n_2 6 do $R[j] \leftarrow A[q+j]$ 7 $L[n_1+1] \leftarrow \infty$ $R[n_2+1] \leftarrow \infty$ 8 9 $i \leftarrow 1$ *i* ← 1 10 for $k \leftarrow p$ to r11 12 do if $L[i] \leq R[j]$ 13 then $A[k] \leftarrow L[i]$ 14 $i \leftarrow i + 1$ 15 else $A[k] \leftarrow R[j]$ $i \leftarrow i + 1$ 16

Loop Invariant for the *for* loop At the start of each iteration of the for loop:

Subarray A[p..k-1]contains the k - p smallest elements of L and R in sorted order. L[i] and R[j] are the smallest elements of L and R that have not been copied back into A.

<u>Initialization:</u> Before the first iteration

•*A*[*p*..*k*-1] is empty.
•*i* = *j* = 1.
•*L*[1] and *R*[1] are the smallest elements of *L* and *R* not copied to *A*.

Correctness of Merge

Merge(*A*, *p*, *q*, *r*)

1 $n_1 \leftarrow q - p + 1$ 2 $n_2 \leftarrow r - q$ for $i \leftarrow 1$ to n_1 3 do $L[i] \leftarrow A[p + i - 1]$ 4 for $j \leftarrow 1$ to n_2 5 6 do $R[j] \leftarrow A[q + j]$ 7 $L[n_1+1] \leftarrow \infty$ $R[n_2+1] \leftarrow \infty$ 8 9 *i* ← 1 *j* ← 1 10 for $k \leftarrow p$ to r11 12 do if $L[i] \leq \overline{R[j]}$ then $A[k] \leftarrow L[i]$ 13 14 $i \leftarrow i + 1$ 15 else $A[k] \leftarrow R[j]$ $i \leftarrow i + 1$ 16

Maintenance:

Case 1: $L[i] \le R[j]$ •By LI, *A* contains p - k smallest elements of *L* and *R* in sorted order. •By LI, L[i] and R[j] are the smallest elements of *L* and *R* not yet copied into *A*. •Line 13 results in *A* containing p - k + 1smallest elements (again in sorted order). Incrementing *i* and *k* reestablishes the LI for the next iteration.

Similarly for *L*[*i*] > *R*[*j*]

Termination:

On termination, k = r + 1.
By LI, A contains r - p + 1 smallest elements of L and R in sorted order.
L and R together contain r - p + 3 elements. All but the two sentinels have been copied back into A.

Analysis of Merge Sort

- Running time *T*(*n*) of Merge Sort:
- Divide: computing the middle takes O(1)
- Conquer: solving 2 subproblems takes 27(n/2)
- Combine: merging n elements takes
 O(n)
- Total:

 $T(n) = \Theta(1)$ if n = 1 $T(n) = 2T(n/2) + \Theta(n)$ if n > 1

 $\Rightarrow T(n) = \Theta(n \lg n)$
