

Lecture 25

PRINCIPLES OF SATELLITE COMMUNICATION

ORBIT

- The satellite revolve around the earth in specified orbit.
- The two forces acting earth are
 - Force of momentum
 - Force of gravity

Types of satellite orbits

- Geosynchronous satellites(GEO)
- Low earth orbit satellites(LEO)
- Medium earth orbit satellites(MEO)

Geostationary (geosynchronous) orbits:

An orbit which places the satellite above the same location at all times

- Must be orbiting approximately 36,000 km above the Earth

Low earth orbit satellites

(LEO) :

- defined as an orbit below an altitude of approximately 2,000 kilometers.
- an orbit around Earth between the atmosphere
- it requires less energy to place a satellite into a LEO and the LEO satellite needs less power amplifiers for successful transmission

Medium earth orbit satellites (MEO):

- around the Earth above low Earth orbit (2,000 kilometres) and below geostationary orbit (35,786 kilometres)
- The most common for navigation

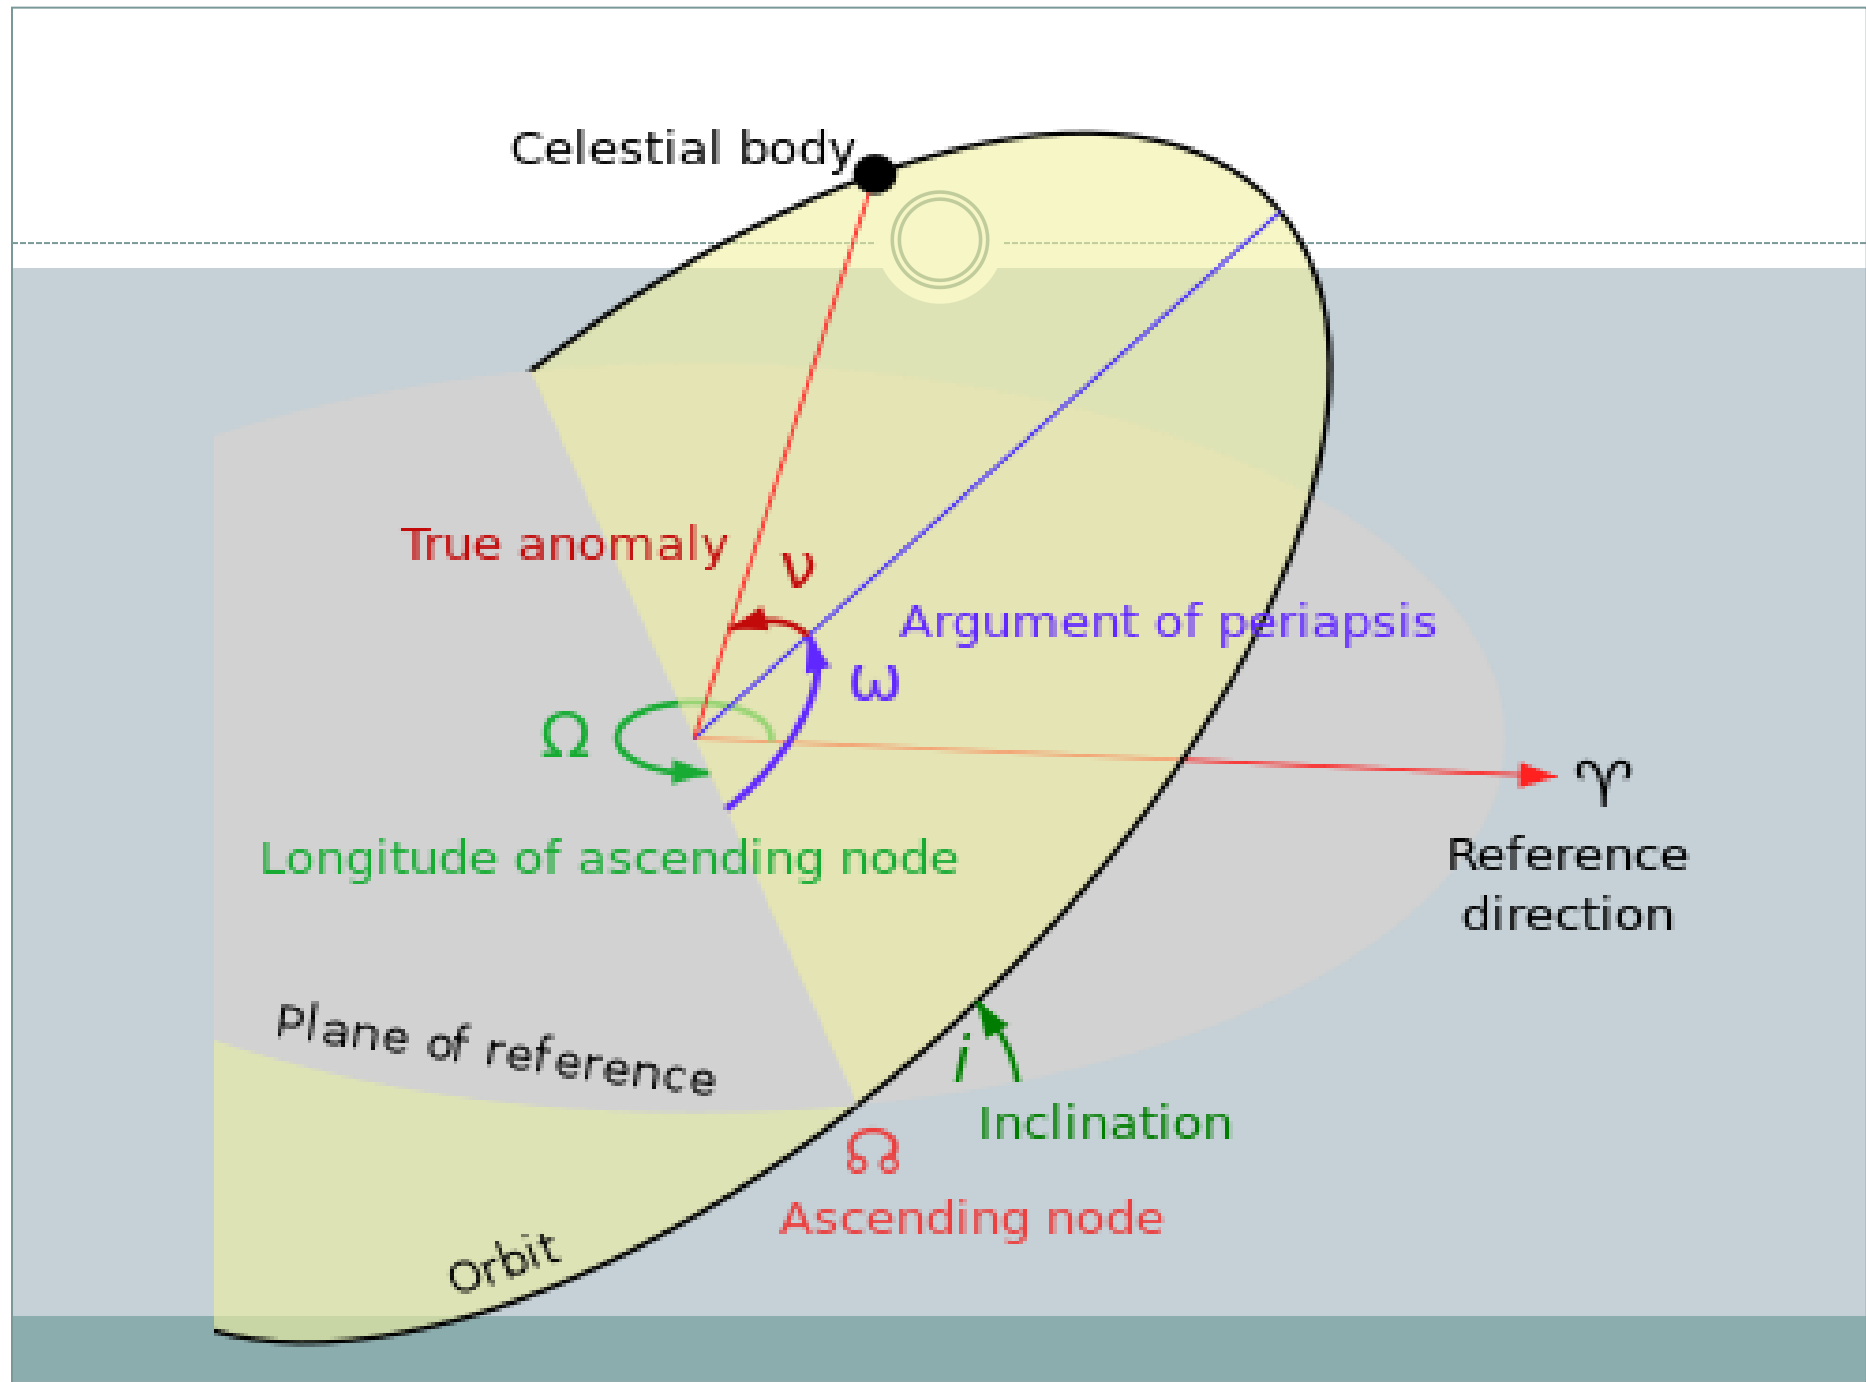

Synchronous orbits

- **An orbit in which the satellite passes every location at the same time each day**
 - **Noon satellites: pass over near noon and midnight**
 - **Morning satellites: pass over near dawn and dusk**
 - **Often referred to as “polar orbiters” because of the high latitudes they cross**
 - **Usually orbit within several hundred to a few thousand km from Earth**

ORBITAL ELEMENTS

- Ω Right Ascension of the Ascending Node
- i Inclination of the orbit
- ω Argument of Perigee
- M mean anomaly (epoch)
- e Eccentricity of the elliptical orbit
- a Semi-major axis of the orbit ellipse

KEPLER'S THREE LAWS

- Orbit is an ellipse with the larger body (earth) at one focus
- The satellite sweeps out equal arcs (area) in equal time (**NOTE**: for an ellipse, this means that the orbital velocity varies around the orbit)
- The square of the period of revolution is proportional to the cube of the mean distance between the two bodies.

A blue-tinted image of Earth from space, showing the curvature of the planet and a bright star in the upper right corner. The text "LOOK ANGLE" is overlaid in white, serif font.

LOOK ANGLE

Azimuth & Elevation Angles

Azimuth is the axis of angular rotation

Elevation is the Angle with respect to the horizon -

Earth Coverage and slant

range

Geostationary Satellite 35,800 km altitude

mean distance to moon = 384,400 km

17.4°

earth radius = 6,370 km

typical shuttle orbit = 225 – 250 km

Hubble Space Telescope = 600 km

110.8°

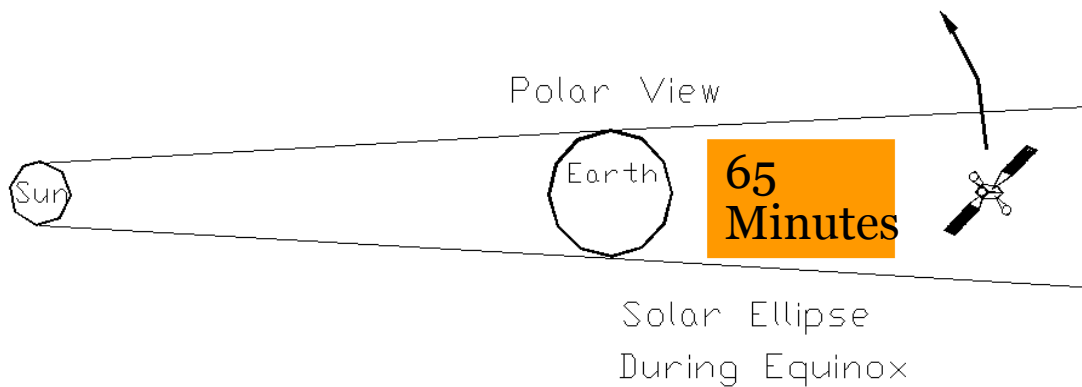

Polar Orbiting Satellite 850 km altitude

Solar Eclipse

Satellites experience a solar eclipse two times a year
Vernal & Autumnal equinoxes for about 6 weeks each year.
Satellites are in the earth's shadow for a few minutes to as
much as 65 minutes on the day of the equinox.

Equinox

During Eclipse

- No Solarpower
- need battery power
- No Solarwarming
- Requires heaters.
