Control Systems

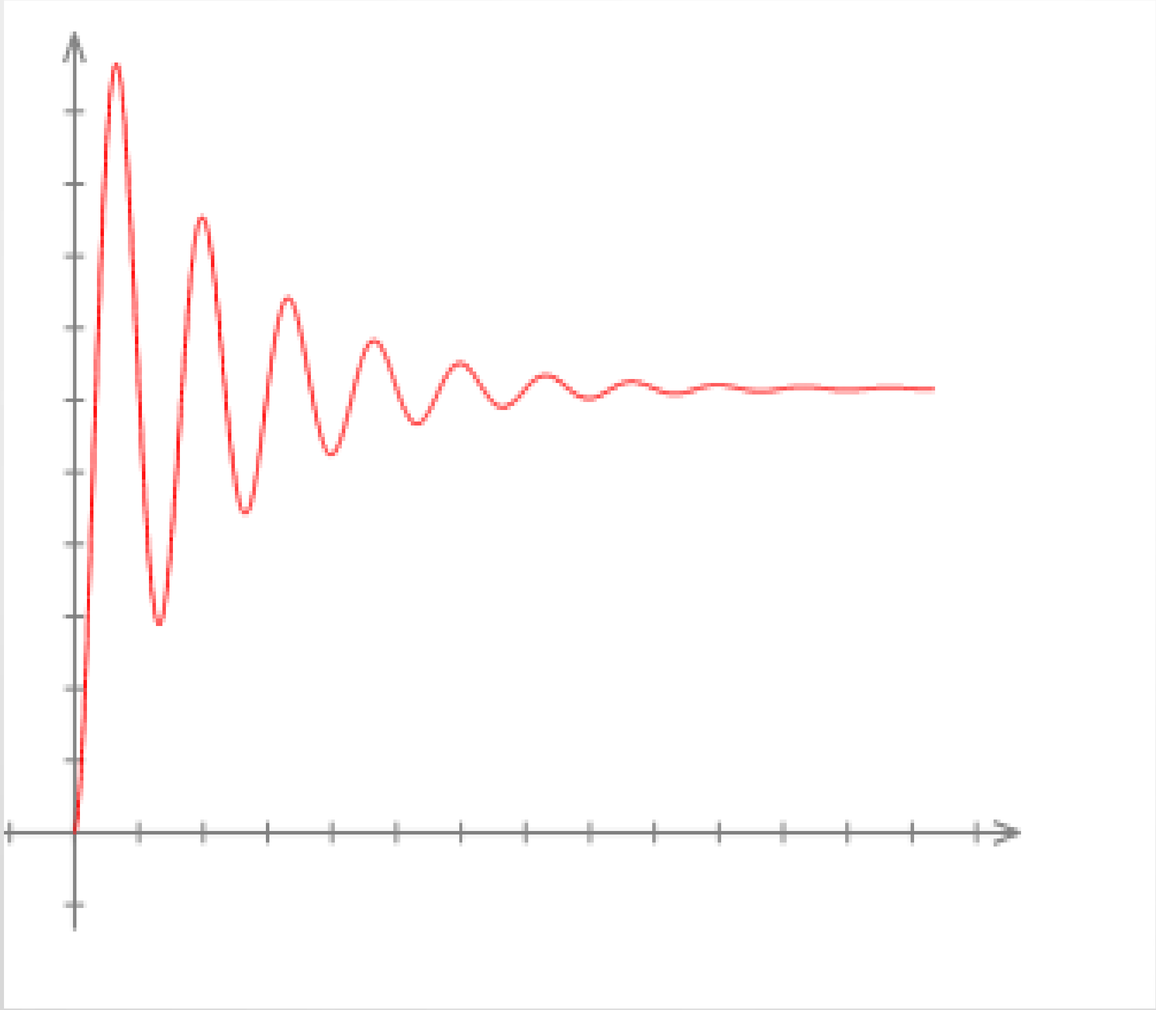
Lecture: 5

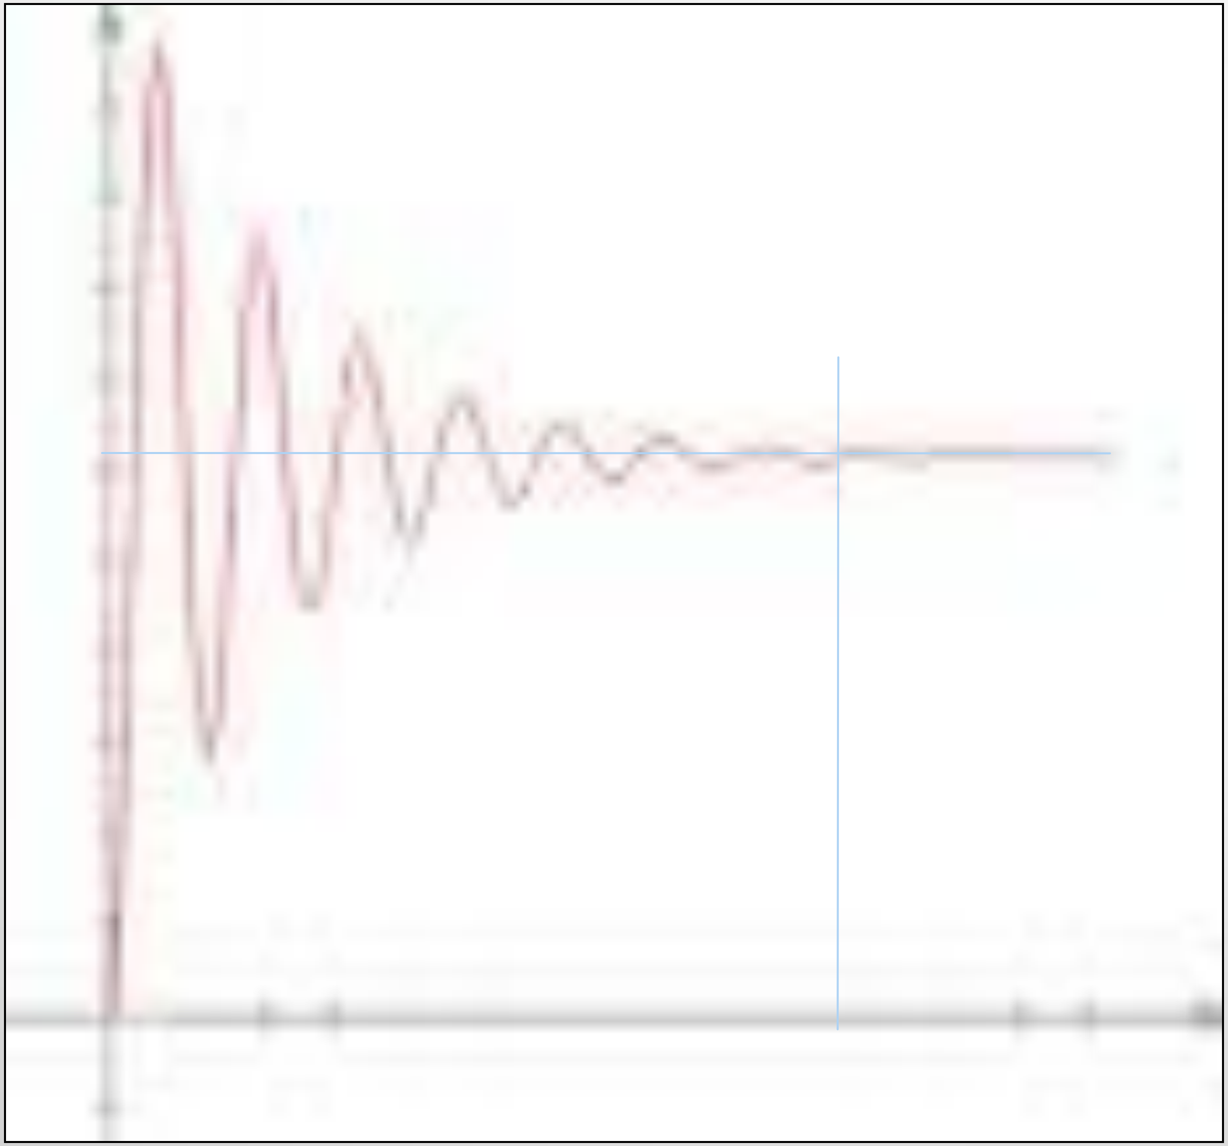
Topics Covered

Time domain analysis

- Time Response:-The response given by the system which is function of the time, to the applied excitation is called a time response of a control system
- The final state achieved by the output is called as steady state
- Output variation during the time it takes to achieve the steady state is called as transient response of the system

- Transient response: the output variation during the time ,it takes to achieve its final value is called as transient Response
- Time required to achieve the final value is called as transient period





TIME RESPONSE OF SECOND ORDER SYSTEM

Delay time& rise time

- Time required to reach 50% of the final value in first attempt
- Time required to reach its peak value
- Settling time: the time needed to settle down afore said oscillations within 2% of thedesired value

Time delay
