

# SOFTWARE ENGINEERING

# LECTURE-19

**Software Engineering Practice**

# TOPICS COVERED

- Software engineering practice
- Communication practices
- Planning practices
- Analysis modeling practices
- Design modeling practices
- Construction practices
- Deployment practices

# SOFTWARE ENGINEERING PRACTICE

- Consists of a collection of concepts, principles, methods, and tools that a software engineer calls upon on a daily basis
- Equips managers to manage software projects and software engineers to build computer programs
- Provides necessary technical and management how to's in getting the job done
- Transforms a haphazard unfocused approach into something that is more organized, more effective, and more likely to achieve success

# THE ESSENCE OF PROBLEM SOLVING

- 1) Understand the problem (communication and analysis)
  - Who has a stake in the solution to the problem?
  - What are the unknowns (data, function, behavior)?
  - Can the problem be compartmentalized?
  - Can the problem be represented graphically?
- 2) Plan a solution (planning, modeling and software design)
  - Have you seen similar problems like this before?
  - Has a similar problem been solved and is the solution reusable?
  - Can subproblems be defined and are solutions available for the subproblems?

(more on next slide)

# THE ESSENCE OF PROBLEM SOLVING (CONTINUED)

- 3) Carry out the plan (construction; code generation)
  - Does the solution conform to the plan? Is the source code traceable back to the design?
  - Is each component of the solution correct? Has the design and code been reviewed?
- 4) Examine the results for accuracy (testing and quality assurance)
  - Is it possible to test each component of the solution?
  - Does the solution produce results that conform to the data, function, and behavior that are required?

# SEVEN CORE PRINCIPLES FOR SOFTWARE ENGINEERING

- 1) Remember the reason that the software exists
  - The software should provide value to its users and satisfy the requirements
- 2) Keep it simple, stupid (KISS)
  - All design and implementation should be as simple as possible
- 3) Maintain the vision of the project
  - A clear vision is essential to the project's success
- 4) Others will consume what you produce
  - Always specify, design, and implement knowing that someone else will later have to understand and modify what you did
- 5) Be open to the future
  - Never design yourself into a corner; build software that can be easily changed and adapted
- 6) Plan ahead for software reuse
  - Reuse of software reduces the long-term cost and increases the value of the program and the reusable components
- 7) Think, then act
  - Placing clear, complete thought before action will almost always produce better results

# COMMUNICATION PRACTICES (REQUIREMENTS ELICITATION)

Communication  
Project initiation  
Requirements  
gathering

Planning  
Estimating  
Scheduling  
Tracking

Modeling  
Analysis  
Design

Construction  
Code  
Test

Deployment  
Delivery  
Support  
Feedback

# COMMUNICATION PRINCIPLES

- 1) Listen to the speaker and concentrate on what is being said
- 2) Prepare before you meet by researching and understanding the problem
- 3) Someone should facilitate the meeting and have an agenda
- 4) Face-to-face communication is best, but also have a document or presentation to focus the discussion
- 5) Take notes and document decisions
- 6) Strive for collaboration and consensus
- 7) Stay focused on a topic; modularize your discussion
- 8) If something is unclear, draw a picture
- 9) Move on to the next topic a) after you agree to something, b) if you cannot agree to something, or c) if a feature or function is unclear and cannot be clarified at the moment
- 10) Negotiation is not a contest or a game; it works best when both parties win

# PLANNING PRACTICES (DEFINING A ROAD MAP)

Communication  
Project initiation  
Requirements  
gathering

Planning  
Estimating  
Scheduling  
Tracking

Modeling  
Analysis  
Design

Construction  
Code  
Test

Deployment  
Delivery  
Support  
Feedback

# PLANNING PRINCIPLES

- 1) Understand the scope of the project
- 2) Involve the customer in the planning activity
- 3) Recognize that planning is iterative; things will change
- 4) Estimate based only on what you know
- 5) Consider risk as you define the plan
- 6) Be realistic on how much can be done each day by each person and how well
- 7) Adjust granularity as you define the plan
- 8) Define how you intend to ensure quality
- 9) Describe how you intend to accommodate change
- 10) Track the plan frequently and make adjustments as required

# BARRY BOEHM'S W<sup>5</sup>HH PRINCIPLE

- Why is the system being developed?
- What will be done?
- When will it be accomplished?
- Who is responsible for each function?
- Where are they organizationally located?
- How will the job be done technically and managerially?
- How much of each resource is needed?

The answers to these questions lead to a definition of key project characteristics and the resultant project plan

# MODELING PRACTICES (ANALYSIS AND DESIGN)

Communication  
Project initiation  
Requirements  
gathering

Planning  
Estimating  
Scheduling  
Tracking

Modeling  
Analysis  
Design

Construction  
Code  
Test

Deployment  
Delivery  
Support  
Feedback

# ANALYSIS MODELING PRINCIPLES

- 1) The information domain of a problem (the data that flows in and out of a system) must be represented and understood
- 2) The functions that the software performs must be defined
- 3) The behavior of the software (as a consequence of external events) must be represented
- 4) The models that depict information, function, and behavior must be partitioned in a manner that uncovers detail in a layered (or hierarchical) fashion
- 5) The analysis task should move from essential information toward implementation detail

# DESIGN MODELING PRINCIPLES

- 1) The design should be traceable to the analysis model
- 2) Always consider the software architecture of the system to be built
- 3) Design of data is as important as design of processing functions
- 4) Interfaces (both internal and external) must be designed with care
- 5) User interface design should be tuned to the needs of the end-user and should stress ease of use
- 6) Component-level design should be functionally independent (high cohesion)
- 7) Components should be loosely coupled to one another and to the external environment
- 8) Design representations (models) should be easily understandable
- 9) The design should be developed iteratively; with each iteration, the designer should strive for greater simplicity

External quality factors: those properties that can be readily observed

Internal quality factors: those properties that lead to a high-quality design from a technical perspective

# CONSTRUCTION PRACTICES

Communication  
Project initiation  
Requirements  
gathering

Planning  
Estimating  
Scheduling  
Tracking

Modeling  
Analysis  
Design

Construction  
Code  
Test

Deployment  
Delivery  
Support  
Feedback

# CODING PRINCIPLES

## (PREPARATION BEFORE CODING)

- 1) Understand the problem you are trying to solve
- 2) Understand basic design principles and concepts
- 3) Pick a programming language that meets the needs of the software to be built and the environment in which it will operate
- 4) Select a programming environment that provides tools that will make your work easier
- 5) Create a set of unit tests that will be applied once the component you code is completed

# CODING PRINCIPLES

## (AS YOU BEGIN CODING)

- 1) Constrain your algorithms by following structured programming practices
- 2) Select data structures that will meet the needs of the design
- 3) Understand the software architecture and create interfaces that are consistent with it
- 4) Keep conditional logic as simple as possible
- 5) Create nested loops in a way that makes them easily testable
- 6) Select meaningful variable names and follow other local coding standards
- 7) Write code that is self-documenting
- 8) Create a visual layout (e.g., indentation and blank lines) that aids code understanding

# CODING PRINCIPLES

## (AFTER COMPLETING THE FIRST ROUND OF CODE)

- 1) Conduct a code walkthrough
- 2) Perform unit tests (black-box and white-box) and correct errors you have uncovered
- 3) Refactor the code

# TESTING PRINCIPLES

- 1) All tests should be traceable to the software requirements
- 2) Tests should be planned long before testing begins
- 3) The Pareto principle applies to software testing
  - 80% of the uncovered errors are in 20% of the code
- 4) Testing should begin “in the small” and progress toward testing “in the large”
  - Unit testing --> integration testing --> validation testing --> system testing
- 5) Exhaustive testing is not possible

# TEST OBJECTIVES

- 1) Testing is a process of executing a program with the intent of finding an error
- 2) A good test case is one that has a high probability of finding an as-yet undiscovered error
- 3) A successful test is one that uncovers an as-yet undiscovered error

# DEPLOYMENT PRACTICES

Communication  
Project initiation  
Requirements  
gathering

Planning  
Estimating  
Scheduling  
Tracking

Modeling  
Analysis  
Design

Construction  
Code  
Test

Deployment  
Delivery  
Support  
Feedback

# DEPLOYMENT PRINCIPLES

- 1) Customer expectations for the software must be managed
  - Be careful not to promise too much or to mislead the user
- 2) A complete delivery package should be assembled and tested
- 3) A support regime must be established before the software is delivered
- 4) Appropriate instructional materials must be provided to end users
- 5) Buggy software should be fixed first, delivered later
