## COURSE: THEORY OF AUTOMATA COMPUTATION

## TOPICS TO BE COVERED

- Limitations of FSM

## LIMITATIONS OF FAS

Problem: Is there any set not regular ?
ans: yes!
example: $B=\left\{a^{n} b^{n} \mid n \geq 0\right\}=\{\varepsilon, a b, a a b b, a a a b b b, \ldots\}$

Intuition: Any machine accepting $B$ must be able to remember the number of a's it has scanned before encountering the first $b$, but this requires infinite amount of memory (states) and is beyond the capability of any FA which has only a finite amount of memory (states).

## THE PROOF

Lemma 1: Let $M=(Q, \Sigma, \delta, s, F)$ be any DFA accepting $B$. Then for all non-negative numbers $\mathrm{m}, \mathrm{n}, \mathrm{m} \neq \mathrm{n}$ implies $\Delta\left(\mathrm{s}, \mathrm{a}^{\mathrm{m}}\right) \neq \Delta\left(\mathrm{s}, \mathrm{a}^{\mathrm{n}}\right)$.
pf : Assume $\Delta\left(\mathrm{s}, \mathrm{a}^{\mathrm{m}}\right)=\Delta\left(\mathrm{s}, \mathrm{a}^{\mathrm{n}}\right)$ from some $\mathrm{m} \neq \mathrm{n}$. Then $\Delta(\mathrm{s}$, $\left.a^{m} b^{n}\right)=\Delta\left(\Delta\left(s, a^{m}\right), b^{n}\right)$

$$
=\Delta\left(\Delta\left(\mathrm{s}, \mathrm{a}^{\mathrm{n}}\right), \mathrm{b}^{\mathrm{n}}\right)=\Delta\left(\mathrm{s}, \mathrm{a}^{\mathrm{n}} \mathrm{~b}^{\mathrm{n}}\right) \in \mathrm{F}
$$

It implies $a^{m} b^{n} \in L(M)=B$. But $a^{m} b^{n} \notin B$ since $m \neq n$. Hence $\Delta\left(s, a^{m}\right) \neq \Delta\left(s, a^{n}\right)$ for all $m \neq n$.
Theorem: B is not regular.
Pf: Assume $B$ is regular and accepted by some DFA $M$ with $k$ states.
But by Lemma1, M must have an infinite number of states ( since all $\Delta\left(\mathrm{s}, \mathrm{a}^{\mathrm{m}}\right) \in \mathrm{Q}(\mathrm{m}=0,1,2, \ldots)$ must be distinct. $)$. This contradicts the requirement that the state set $Q$ of $M$ is finite.

## ANOTHER NONREGULAR SET

- $C=\left\{a^{2 n} \mid n>0\right\}=\{a$, aa, aaaa, aaaaaaaa, $\ldots\}$ is nonregular pf : assume C is regular and is accepted by a DFA with k states.
Let $\mathrm{n}>\mathrm{k}$ and $\mathrm{x}=\mathrm{a}^{2^{\mathrm{n}}} \in \mathrm{C}$. Now consider the sequence of states: $\Delta(\mathrm{s}, \mathrm{a}), \Delta(\mathrm{s}, \mathrm{aa}), \ldots . ., \Delta\left(\mathrm{s}, \mathrm{a}^{\mathrm{n}}\right)$,

$$
s-a-s_{1}-a-s_{2}-\ldots s_{i}-a-s_{i+1}-a \ldots-s_{i+d}--a--\ldots-s_{n}
$$

by pigeonhole principle, there are $0<i<i+d \leq n s . t$.

$$
\Delta\left(\mathrm{s}, \mathrm{a}^{\mathrm{i}}\right)=\Delta\left(\mathrm{s}, \mathrm{a}^{\mathrm{i}+\mathrm{d}}\right) \quad[=\mathrm{p}]
$$

let $2^{\mathrm{n}}=\mathrm{i}+\mathrm{d}+\mathrm{m}$.
$\Rightarrow \Delta\left(s, a^{2^{n+d}}\right)=\Delta\left(s, a^{i} a^{d} a^{d} a^{m}\right)=\Delta\left(s, a^{i} a^{d} a^{m}\right)=\Delta\left(s, a^{2^{n}}\right) \in F$. But since $2^{n}+d<2^{n}+n<2^{n}+2^{n}=2^{n+1}$, which is the next power of $2>2^{n}$, Hence $a^{2{ }^{n+d}} \notin C$
=> the DFA also accepts a string $\notin \mathrm{C}$, a contradiction! Hence C is not regular.

## INTUITION BEHIND THE PUMPING LEMMA

## FOR FA

- For an FA to accept a long string s ( $\geq$ its number of states), the visited path for s must contains a cycle and hence can be cut or repeated
to accept also many new strings.

## Theorem 11.1; If $A$ is a regular set, then

 there exists a decomposition $y=u v w$ s.t. $v \neq \varepsilon$ and for all $i \geq 0$, the string $x u v^{i} w z \in A$.
pf : Similar to the previous examples. Let $\mathrm{k}=|\mathrm{Q}|$ where Q is the set of states in a DFA accepting A. Also let s and F be the initial and set of final states of the FA, respectively. Now if there is a string $x y z \in A$ with $|y| \geq k$, consider the sequence of states:

$$
\Delta\left(\mathrm{s}, \mathrm{xy} \mathrm{y}_{0}\right), \Delta\left(\mathrm{s}, \mathrm{xy}_{1}\right), \Delta\left(\mathrm{s}, \mathrm{xy} \mathrm{y}_{2}\right), \ldots \Delta\left(\mathrm{s}, \mathrm{xy}_{\mathrm{k}}\right),
$$

where $y_{j}(j=0 . . k)$ denote the prefix of $y$ of the first $j$ symbols. Since there are $k+1$ items in the sequence, each a state in Q , by pigeonhole principle, there must exist two items $\Delta\left(\mathrm{s}, \mathrm{xy}_{\mathrm{m}}\right), \Delta\left(\mathrm{s}, \mathrm{xy}_{\mathrm{n}}\right)$ corresponding to the same state. Without loss of generality, assume $m<n$. Now let $u=y_{m}, y_{n}=u v a n d y=u v w$.
We thus have $\Delta(\mathrm{s}, \mathrm{xuwz})=\Delta\left(\mathrm{s}, \mathrm{xy}_{\mathrm{m}} \mathrm{wz}\right)=\Delta(\mathrm{s}, \mathrm{xy} \mathrm{n} \mathrm{wz})=\Delta(\mathrm{s}, \mathrm{xuvwz}) \in \mathrm{F}$ Likewise, for all $\mathrm{j}>1, \Delta\left(\mathrm{~s}, \mathrm{xuv}^{j} \mathrm{wz}\right)=\Delta\left(\mathrm{xuv}^{\mathrm{j}} \mathrm{v}^{-1} \mathrm{wz}\right)=\Delta\left(\mathrm{xuv}^{j-1} \mathrm{Wz}\right)=\ldots=\Delta\left(\mathrm{xuv}^{j-2}\right.$ $w z)=\ldots=\Delta(s, x u v w z) \in F$. QED

Theorem 111: Let A be any language. If A is a regular, then
 there exist a decomposition $\mathrm{y}=\mathrm{uvw}$ s.t. $v \neq \varepsilon$ and for all $i \geq 0$, the string $x u v^{i} w z \in A$.

Theorem 11.2 (pumping lemma, the contropositive form) If A is any language satisfying the property $(\sim \mathrm{P})$ : $\forall \mathrm{k}>0 \exists \mathrm{xyz} \in \mathrm{As.t} .|\mathrm{y}| \geq \mathrm{k}$ and $\forall \mathrm{u}, \mathrm{v}, \mathrm{w}$ with $\mathrm{uvw}=\mathrm{y}$ and v $\neq \varepsilon$, there exists an $\mathrm{i} \geq 0$ s.t. xuvivw $\notin \mathrm{A}$, then A is not regular. [ $\sim \mathrm{P}$ means for any $\mathrm{k}>0$, there is a substring of length $\geq \mathrm{k}$ [of a member] of $A$, a cut or a certain duplicates of the middle of any segment decomposition of which will produce a string A. ]

## GAME SEMANTICS FOR QUANTIFICATION

1. Two players:

- You (want to show a theorem T holds)
- Demon (the opponent want to show T does not hold)
- rules: If the game (or proposition) G is
$\bigcirc \forall x: U, F==>D$ pick a member a of $U$ and continue the game $F(a)$.
$\bigcirc \exists x: U, F==>Y$ choose a nmember $b$ of $U$ and continue the game F(b).
$\bigcirc$ if $G$ has no quantification then end.
- Result:
- Y win if the resulting proposition holds
- D wins o/w
- T holds if $Y$ has a winning strategy (always wins).

## EXAMPLES

$\odot$ Show that ( $\forall x$ :nat, $\exists \mathrm{y}$ :nat, $x<y$ ). pf:

D: choose any number $k$ for $x$.
Y: let $y$ be $k+1$
Result: $k$ < $k+1$, so $Y$ wins.
Since $Y$ always wins in this game. The result is proved.
The winning strategy is the function : $\mathrm{k} \mid->\mathrm{k}+1$.
○ Show that ( $\forall x$ :nat, $\exists \mathrm{y}$ :nat, $\mathrm{y}<\mathrm{x}$ ).
pf: D: pick number 0 for $x$
$Y$ : either fail or
pick a number $m$ for $y$.
D wins since $\sim(0<m)$. Hence the statement is not proved.

1. GAopEayers:EORETICAL PROOF OF

- Demon (the opponent want to show that P holds)

2 The game proceeds as follows:

1. $D$ picks a $k>0 \quad$ (if $A$ is regular, $D$ 's best strategy is to pick $k=$ \#states of a FA accepting A)
2. $Y$ picks $x, y, x$ with $x y z \in A$ and $|y| \geq k$.
3. $D$ picks $u, v, w$ s.t. $y=u v w$ and $v \neq \varepsilon$.
4. $Y$ picks $i \geq 0$
5. Finally $Y$ wins if $x u v^{i} w z \notin A$ and $D$ wins if $x u v^{i} w z \in A$.
6. By Theorem 11.2, A is not regular if there is a winning strategy according to which Y always win.
Note: $P$ is a necessary but not a sufficient condition for the regularity of $A$ (i.e., there is nonregular set A satisfying $P$ ).

## USING THE PUMPING LEMMA

$\odot$ Ex1: Show the set $A=\left\{a^{n} b^{m} \mid n \geq m\right\}$ is not regular. the proof:

- 1. D gives $k \quad[$ for any $k>0$ ]
- 2. $Y$ pick $x=a^{k}, y=b^{k}, z=\varepsilon \quad[\exists x y z$ in A with $|y| \geq k]$
- $\quad==>x y z=a^{k} b^{k} \in A$
- 3. D decompose $y=u v w$ with [for all uvw with uvw=y and
- $|u|=j,|v|=m>0$ and $|w|=n \quad v \neq \varepsilon]$
- 4. Y take $\mathrm{i}=2$.
[ $\exists \mathrm{i} \geq 0$ s.t. $x u v^{i} w z \notin A$ ]
- => xuv²wz $=a^{k} b^{j} b^{2 m b} b^{n}=a^{k} b^{k+m} \notin A$
- => Y wins. Hence $A$ is not regular.
- Ex2: $C=\left\{a^{n!} \mid n \geq 0\right\}$ is not regular. pf: similar to Ex1. Left as an exercise. hint: for any k > 0 D chooses, let xyz =akk! $a^{k!} \varepsilon$ and let $\mathrm{i}=0$.

## OTHER TECHNIQUES:

- Using closure property of regular sets.

Ex3: $D=\left\{x \in\{a, b\}^{*} \mid \# a(x)=\# b(x)\right\}$
$=\{\varepsilon, a b, b a, ~ a a b b, ~ a b a b . ~ b a b a, ~ b b a a, ~ a b b a, ~ b a a b, \ldots\}$
is not regular. (Why ?)
if regular $=>D \cap a^{*} b^{*}=\left\{a^{n} b^{n} \mid n \geq 0\right\}=B$ is regular.
But $B$ is not regular, $D$ thus is not regular.

- [H2E2:] A: any language; if $A$ is regular, then $\operatorname{rev}(A)=_{\text {def }}\left\{x_{n} x_{n-1} \ldots x_{1} \mid x_{1} x_{2} \ldots x_{n} \in A\right\}$ is regular.
- Ex4: $A=\left\{a^{n} b^{m} \mid m \geq n\right\}$ is not regular. pf : If A is regular $=>\operatorname{rev}(\mathrm{A})$ and $\mathrm{h}\left((\operatorname{rev}(\mathrm{A}))=\left\{a^{\mathrm{n}} \mathrm{b}^{m} \mid \mathrm{n} \geq \mathrm{m}\right\}\right.$ is regular, where $h(a)=b$ and $h(b)=a$.
$=>A \cap h(\operatorname{rev}(A))=\left\{a^{n} b^{n} \mid n \geq 0\right\}$ is regular, a contradiction!
