

**COURSE:
THEORY OF
AUTOMATA
COMPUTATION**

TOPICS TO BE COVERED

- ◉ Non Regular Languages
- ◉ Pumping Lemma

**NON REGULAR LANGUAGE
HOW CAN WE PROVE THAT A LANGUAGE
IS NOT REGULAR?**

Non-regular languages

$$\{a^n b^n : n \geq 0\}$$

$$\{vv^R : v \in \{a,b\}^*\}$$

Regular languages

$$a^*b$$

$$b^*c + a$$

$$b + c(a + b)^*$$

etc...

How can we prove that a language L is not regular?

Prove that there is no DFA or NFA or RE that accepts L

Difficulty: this is not easy to prove
(since there is an infinite number of them)

Solution: use the Pumping Lemma !!!

THE PIGEONHOLE PRINCIPLE

4 pigeons

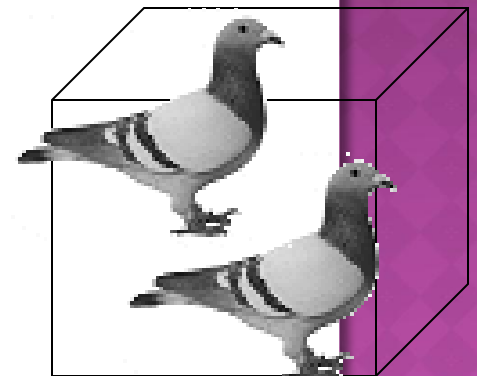

3 pigeonholes

A pigeonhole must contain at least two pigeons

n pigeons

m pigeonholes

$n > m$

THE PIGEONHOLE PRINCIPLE

n pigeons

m pigeonholes

$$n > m$$

There is a pigeonhole
with at least 2 pigeons

THE PIGEONHOLE PRINCIPLE

AND

DFAS

- Consider a DFA with 4 states

Consider the walk of a "long" string: $aaaaab$
(length at least 4)

A state is repeated in the walk of $aaaaab$

The state is repeated as a result of the pigeonhole principle

Walk of $aaaaab$

Pigeons:
(walk states)

Are more than

Nests:
(Automaton states)

Repeated
state

Consider the walk of a "long" string: $aabb$
(length at least 4)

Due to the pigeonhole principle:

A state is repeated in the walk of $aabb$

The state is repeated as a result of the pigeonhole principle

Walk of $aabb$

Pigeons:
(walk states)

Are more than

Nests:
(Automaton states)

Automaton States

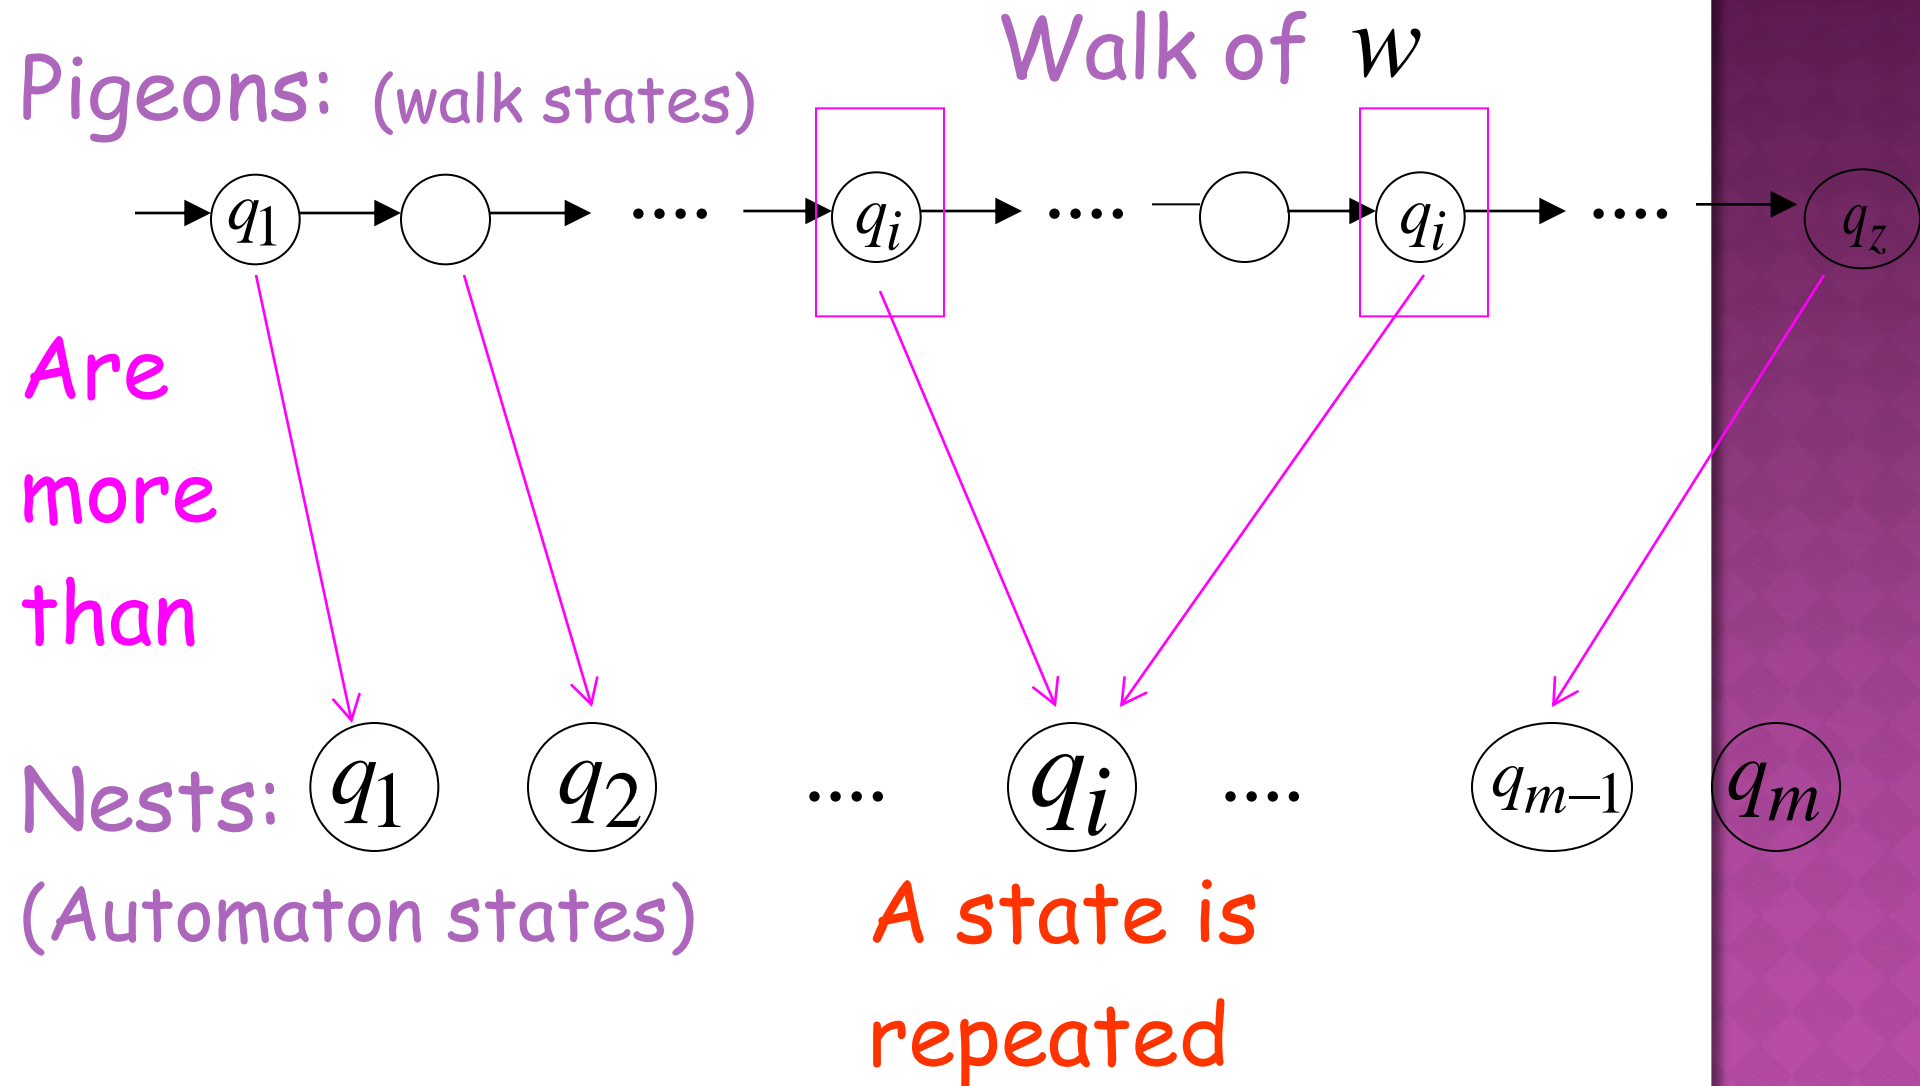

Repeated state

In General: If $|w| \geq \# \text{states of DFA}$,
by the pigeonhole principle,
a state is repeated in the walk w

Walk of $w = \sigma_1 \sigma_2 \cdots \sigma_k$

$$|w| \geq \# \text{states of DFA} = m$$

THE PUMPING LEMMA

Take an **infinite** regular language L
(contains an infinite number of strings)

There exists a DFA that accepts L

m
states

Take string $w \in L$ with $|w| \geq m$

(number of
states of DFA)

then, at least one state is repeated
in the walk of w

There could be many states repeated

Take q to be the first state repeated

One dimensional projection of walk w :

We can write $w = xyz$

One dimensional projection of walk w :

In DFA:

$$w = x y z$$

contains only
first occurrence of q

Observation:

length $|x y| \leq m$ number of states of DFA

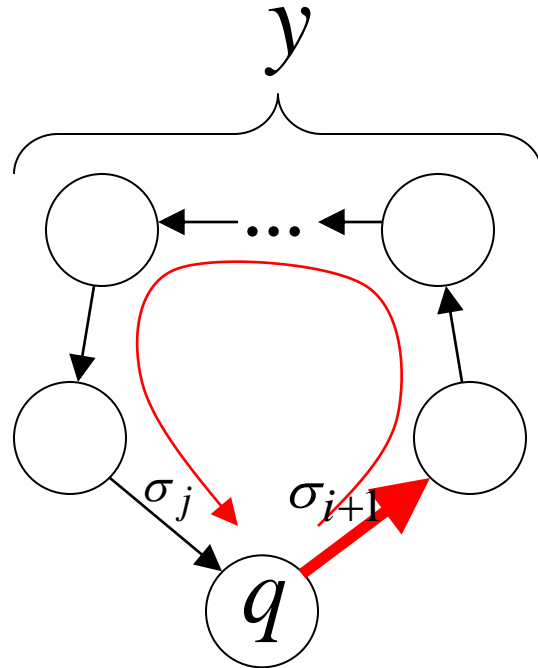

Unique States

Since, in xy no state is repeated (except q)

Observation: $\text{length } |y| \geq 1$

Since there is at least one transition in loop

We do not care about the form of string z .

z may actually overlap with the paths of x and y

Additional string: The string xz is accepted

Do not follow loop

Additional string:

The string $x y y z$
is accepted

Follow loop
2 times

Additional string:

The string
is accepted

$x y y y z$

Follow loop
3 times

In General:

The string

$x y^i z$

is accepted

$i = 0, 1, 2, \dots$

Follow loop
 i times

Therefore:

$$x y^i z \in L \quad i = 0, 1, 2, \dots$$

Language accepted by the DFA

- Given a infinite regular language

THE PUMPING LEMMA: L

- there exists an integer m (critical length)
- for any string $w \in L$ with length $|w| \geq m$
- we can write $w = x y z$
- with $|x y| \leq m$ and $|y| \geq 1$
- such that: $x y^i z \in L \quad i = 0, 1, 2, \dots$

In the book:

Critical length m = Pumping length p
