# Quine-McCluskey (Tabular) Minimization

---

---

- Two step process utilizing tabular listings to:
    - Identify prime implicants (implicant tables)
    - Identify minimal PI set (cover tables)
  - All work is done in tabular form
    - Number of variables is not a limitation
    - Basis for many computer implementations
    - Don't cares are easily handled
  - Proper organization and term identification are key factors for correct results
-

# Quine-McCluskey Minimization (cont.)

---

---

- Terms are initially listed one per line in groups
    - Each group contains terms with the same number of true and complemented variables
    - Terms are listed in numerical order within group
  - Terms and implicants are identified using one of three common notations
    - full variable form
    - cellular form
    - 1,0,- form
-

# Notation Forms

---

---

- Full variable form - variables and complements in algebraic form
    - hard to identify when adjacency applies
    - very easy to make mistakes
  - Cellular form - terms are identified by their decimal index value
    - Easy to tell when adjacency applies; indexes must differ by power of two (one bit)
    - Implicants identified by term nos. separated by comma; differing bit pos. in () following terms
-

## Notation Forms (cont.)

---

---

- 1,0,- form - terms are identified by their binary index value
    - Easier to translate to/from full variable form
    - Easy to identify when adjacency applies, one bit is different
    - - shows variable(s) dropped when adjacency is used
  - Different forms may be mixed during the minimization
-

# Example of Different Notations

---

---

$$F(A, B, C, D) = \Sigma m(4,5,6,8,10,13)$$

# Implication Table (1,0,-)

- Quine-McCluskey Method

- Tabular method to systematically find all prime implicants
- $f(A,B,C,D) = \sum m(4,5,6,8,9,10,13) + \sum d(0,7,15)$
- Part 1: Find all prime implicants
- Step 1: Fill Column 1 with active-set and DC-set minterm indices. Group by number of true variables (# of 1's).

**NOTE: DCs are included in this step!**

# Minimization - First Pass (1,0,-)

- Quine-McCluskey Method

- Tabular method to systematically find all prime implicants
- $f(A,B,C,D) = \Sigma m(4,5,6,8,9,10,13) + \Sigma d(0,7,15)$
- Part 1: Find all prime implicants
- Step 2: Apply Adjacency - Compare elements of group with N 1's against those with N+1 1's. One bit difference implies adjacent. Eliminate variable and place in next column.

E.g., 0000 vs. 0100 yields 0-00

0000 vs. 1000 yields -000

When used in a combination, mark with a check. If cannot be combined, mark with a star. These are the prime implicants.

Repeat until nothing left.

Prime Implicants:

$$0-00 = \bar{A} \bar{C} \bar{D}$$

$$-000 = \bar{B} \bar{C} \bar{D}$$

$$100- = A \bar{B} \bar{C}$$

$$10-0 = A \bar{B} \bar{D}$$

$$1-01 = A \bar{C} D$$

$$-1-1 = B D$$

$$01-- = \bar{A} B$$

**Prime Implicants:**

$$0-00 = \bar{A} \bar{C} \bar{D} \quad -000 = \bar{B} \bar{C} \bar{D}$$

$$100- = A \bar{B} \bar{C} \quad 10-0 = A \bar{B} \bar{D}$$

$$1-01 = A \bar{C} D \quad -1-1 = B D$$

$$01-- = \bar{A} B$$

**Stage 2: find smallest set of prime implicants that cover the active-set**

**recall that essential prime implicants must be in final expression**
