

# The Laws of Thermodynamics

# Principles of Thermodynamics

- ❑ Energy is conserved
  - o FIRST LAW OF THERMODYNAMICS
  - o Examples: Engines (Internal -> Mechanical)  
Friction (Mechanical -> Internal)
- ❑ All processes must increase *entropy*
  - o SECOND LAW OF THERMODYNAMICS
  - o Entropy is measure of disorder
  - o Engines can not be 100% efficient

# Converting Internal Energy to Mechanical

$$\Delta U = Q - P\Delta V$$

Work done by expansion

$$W = F\Delta x, \quad F = PA, \quad \Delta x = \Delta V / A$$

$$W = P\Delta V$$

## Example

A cylinder of radius 5 cm is kept at pressure with a piston of mass 75 kg.

- a) What is the pressure inside the cylinder?
- b) If the gas expands such that the cylinder rises 12.0 cm, what work was done by the gas?
- c) What amount of the work went into changing the gravitational PE of the piston?
- d) Where did the rest of the work go?

# Solution

Given:  $M = 75$ ,  $A = \pi \cdot 0.05^2$ ,  $\Delta x = 0.12$ ,  $P_{\text{atm}} = 1.013 \times 10^5 \text{ Pa}$

a) Find  $P_{\text{gas}}$

$$P_{\text{gas}} = \frac{Mg}{A} + P_{\text{atm}} = 1.950 \times 10^5 \text{ Pa}$$

b) Find  $W_{\text{gas}}$

$$W = P \Delta V \quad W = P_{\text{gas}} A \Delta x = 183.8 \text{ J}$$

c) Find  $W_{\text{gravity}}$

$$W = mgh = 88.3 \text{ J}$$

d) Where did the other work go?

Compressing the outside air

## Quiz Review

A massive copper piston traps an ideal gas as shown to the right. The piston is allowed to freely slide up and down and equilibrate with the outside air. Pick the most correct statement?

- A. The pressure is higher inside the cylinder than outside.
- B. The temperature inside the cylinder is higher than outside the cylinder.
- C. If the gas is heated by applying a flame to cylinder, and the piston comes to a new equilibrium, the inside pressure will have increased.
- D. All of the above.
- E. A and C.

# Some Vocabulary

## □ Isobaric

o  $P = \text{constant}$

## □ Isovolumetric

o  $V = \text{constant}$

## □ Isothermal

o  $T = \text{constant}$

## □ Adiabatic

o  $Q = 0$

## Example

Outside Air: Room T, Atm. P

A massive piston traps an amount of Helium gas as shown. The piston freely slides up and down.

The system initially equilibrates at room temperature (a)

Weight is slowly added to the piston, **isothermally** compressing the gas to half its original volume (b)

A.  $P_b$  ( $>$ ) ( $<$ ) ( $=$ )  $P_a$

B.  $T_b$  ( $>$ ) ( $<$ ) ( $=$ )  $T_a$

C.  $W_{ab}$  ( $>$ ) ( $<$ ) ( $=$ ) 0

D.  $U_b$  ( $>$ ) ( $<$ ) ( $=$ )  $U_a$

E.  $Q_{ab}$  ( $>$ ) ( $<$ ) ( $=$ ) 0

$$\Delta U = Q - P\Delta V$$
$$W = P\Delta V$$

Vocabulary:  $W_{ab}$  is work done by gas between a and b

$Q_{ab}$  is heat added to gas between a and b

## Example

Outside Air: Room T, Atm. P

A massive piston traps an amount of Helium gas as shown. The piston freely slides up and down.

The system initially equilibrates at room temperature (a)

Weight is slowly added to the piston, **adiabatically** compressing the gas to half its original volume (b)

A.  $P_b$  ( $>$   $<$   $=$ )  $P_a$

B.  $W_{ab}$  ( $>$   $<$   $=$ ) 0

C.  $Q_{ab}$  ( $>$   $<$   $=$ ) 0

D.  $U_b$  ( $>$   $<$   $=$ )  $U_a$

E.  $T_b$  ( $>$   $<$   $=$ )  $T_a$

$$\Delta U = Q - P\Delta V$$
$$W = P\Delta V$$

Vocabulary:  $W_{ab}$  is work done by gas between a and b

$Q_{ab}$  is heat added to gas between a and b

## Example

Outside Air: Room T, Atm. P

A massive piston traps an amount of Helium gas as shown. The piston freely slides up and down.

The system initially equilibrates at room temperature (a)

The gas is cooled, *isobarically* compressing the gas to half its original volume (b)

A.  $P_b$  ( > < = )  $P_a$

B.  $W_{ab}$  ( > < = ) 0

C.  $T_b$  ( > < = )  $T_a$

D.  $U_b$  ( > < = )  $U_a$

E.  $Q_{ab}$  ( > < = ) 0

$$PV = nRT$$

$$\Delta U = Q - P\Delta V$$
$$W = P\Delta V$$

Vocabulary:  $W_{ab}$  is work done by gas between a and b

$Q_{ab}$  is heat added to gas between a and b

# Work from closed cycles

Consider cycle  $A \rightarrow B \rightarrow A$

# Work from closed cycles

Consider cycle  $A \rightarrow B \rightarrow A$

# Work from closed cycles

Reverse the cycle, make it counter clockwise

# Example

a) What amount of work is performed by the gas in the cycle IAFI?

$$W = \text{enclosed area}$$

$$W_{\text{IAFI}} = 3P_{\text{atm}} = 3.04 \times 10^5 \text{ J}$$

b) How much heat was inserted into the gas in the cycle IAFI?

$$\Delta U = Q - W$$

$$\Delta U = 0 \quad Q = 3.04 \times 10^5 \text{ J}$$

c) What amount of work is performed by the gas in the cycle IBFI?

$$W = -3.04 \times 10^5 \text{ J}$$

## One More Example

Consider a monotonic ideal gas which expands according to the PV diagram.

- a) What work was done by the gas from A to B?
- b) What heat was added to the gas between A and B?
- c) What work was done by the gas from B to C?
- d) What heat was added to the gas between B and C?
- e) What work was done by the gas from C to A?
- f) What heat was added to the gas from C to A?

# Solution

a) Find  $W_{AB}$

$$W_{AB} = \text{Area} = 20,000 \text{ J}$$

b) Find  $Q_{AB}$

## MonotonicGas:

$$U = \frac{3}{2}nRT$$

$$PV = nRT$$

$$U = \frac{3}{2} PV$$

- First find  $U_A$  and  $U_B$

$$U_A = 22,500 \text{ J}, U_B = 22,500 \text{ J}, DU = 0$$

- Finally, solve for  $Q$

$$\Delta U = Q - W$$

$$Q = 20,000 \text{ J}$$

# Solution

c) Find  $W_{BC}$

$$W_{AB} = -\text{Area} = -10,000 \text{ J}$$

d) Find  $Q_{BC}$

$$U = \frac{3}{2} PV$$

•First find  $U_B$  and  $U_C$

$$U_B = 22,500 \text{ J}, U_C = 7,500 \text{ J}, \Delta U = -15,000$$

$$\Delta U = Q - W$$

•Finally, solve for  $Q$

$$Q = -25,000 \text{ J}$$

# Solution

e) Find  $W_{CA}$

$$W_{AB} = \text{Area} = 0 \text{ J}$$

f) Find  $Q_{CA}$

$$U = \frac{3}{2} PV$$

•First find  $U_C$  and  $U_A$

$$U_C = 7,500 \text{ J}, U_A = 22,500 \text{ J}, \Delta U = 15,000$$

$$\Delta U = Q - W$$

•Finally, solve for  $Q$

$$Q = 15,000 \text{ J}$$

## Continued Example

Take solutions from last problem and find:

- a) Net work done by gas in the cycle
- b) Amount of heat added to gas

$$W_{AB} + W_{BC} + W_{CA} = 10,000 \text{ J}$$

$$Q_{AB} + Q_{BC} + Q_{CA} = 10,000 \text{ J}$$

This does NOT mean that the engine is 100% efficient!

**Give Quiz**

# Entropy

- ❑ Measure of Disorder of the system  
(randomness, ignorance)
- ❑  $S = k_B \log(N)$   
 $N = \#$  of possible arrangements for fixed  $E$  and  $Q$

# Entropy

- ❑ Total Entropy always rises!  
(2nd Law of Thermodynamics)
- ❑ Adding heat raises entropy

$$\Delta S = Q / T$$

**Defines temperature in Kelvin!**

# Why does $Q$ flow from hot to cold?

□ Consider two systems, one with  $T_A$  and one with  $T_B$

□ Allow  $Q > 0$  to flow from  $T_A$  to  $T_B$

□ Entropy changed by:

$$DS = Q/T_B - Q/T_A$$

□ If  $T_A > T_B$ , then  $DS > 0$

□ System will achieve more randomness by exchanging heat until  $T_B = T_A$

# Efficiencies of Engines

- Consider a cycle described by:

$W$ , work done by engine

$Q_{\text{hot}}$ , heat that flows into engine from source at  $T_{\text{hot}}$

$Q_{\text{cold}}$ , heat exhausted from engine at lower temperature,  $T_{\text{cold}}$

- Efficiency is defined:

$$e = \frac{W}{Q_{\text{hot}}} = \frac{Q_{\text{hot}} - Q_{\text{cold}}}{Q_{\text{hot}}} = 1 - \frac{Q_{\text{cold}}}{Q_{\text{hot}}}$$

Since  $\Delta S = Q/T > 0$ ,

$$\frac{Q_{\text{cold}}}{T_{\text{cold}}} > \frac{Q_{\text{hot}}}{T_{\text{hot}}} \Rightarrow \frac{Q_{\text{cold}}}{Q_{\text{hot}}} > \frac{T_{\text{cold}}}{T_{\text{hot}}} \Rightarrow$$

$$e < 1 - \frac{T_{\text{cold}}}{T_{\text{hot}}}$$

# Carnot Engines

- ❑ Idealized engine
- ❑ Most efficient possible

$$e = \frac{W}{Q_{hot}} = 1 - \frac{T_{cold}}{T_{hot}}$$

# Carnot Cycle

## Example

An ideal engine (Carnot) is rated at 50% efficiency when it is able to exhaust heat at a temperature of 20 °C. If the exhaust temperature is lowered to -30 °C, what is the new efficiency.

## Solution

Given,  $e=0.5$  when  $T_{\text{cold}}=293 \text{ °K}$ , Find  $e$  when  $T_{\text{cold}}= 243 \text{ °K}$

First, find  $T_{\text{hot}}$

$$e = 1 - \frac{T_{\text{cold}}}{T_{\text{hot}}} \quad T_{\text{hot}} = T_{\text{cold}} \frac{1}{1-e} = 586 \text{ °K}$$

Now, find  $e$  given  $T_{\text{hot}}=586 \text{ °K}$  and  $T_{\text{cold}}=243 \text{ °K}$

$$e = 1 - \frac{T_{\text{cold}}}{T_{\text{hot}}} \quad e = 0.585$$

# Refrigerators

Given: Refrigerated region is at  $T_{\text{cold}}$   
Heat exhausted to region with  $T_{\text{hot}}$   
Find: Efficiency

refrigerator:

$$e = \frac{Q_{\text{cold}}}{W} = \frac{Q_{\text{cold}}}{Q_{\text{hot}} - Q_{\text{cold}}} = \frac{1}{Q_{\text{hot}} / Q_{\text{cold}} - 1}$$

Since  $\Delta S = Q/T > 0$ ,

$$\frac{Q_{\text{hot}}}{T_{\text{hot}}} > \frac{Q_{\text{cold}}}{T_{\text{cold}}} \Rightarrow \frac{Q_{\text{hot}}}{Q_{\text{cold}}} > \frac{T_{\text{hot}}}{T_{\text{cold}}} \Rightarrow$$

refrigerator :

$$e < \frac{1}{T_{\text{hot}} / T_{\text{cold}} - 1}$$

Note: Highest efficiency for small  $T$  differences

# Heat Pumps

Given: Inside is at  $T_{\text{hot}}$   
Outside is at  $T_{\text{cold}}$   
Find: Efficiency

heat pump :

$$e = \frac{Q_{\text{hot}}}{W} = \frac{Q_{\text{hot}}}{Q_{\text{hot}} - Q_{\text{cold}}} = \frac{1}{1 - Q_{\text{cold}} / Q_{\text{hot}}}$$

Since  $\Delta S = Q/T > 0$  ,

$$\frac{Q_{\text{hot}}}{T_{\text{hot}}} > \frac{Q_{\text{cold}}}{T_{\text{cold}}} \Rightarrow \frac{Q_{\text{hot}}}{Q_{\text{cold}}} > \frac{T_{\text{hot}}}{T_{\text{cold}}} \Rightarrow$$

heat pump :

$$e < \frac{1}{1 - T_{\text{cold}} / T_{\text{hot}}}$$

Like Refrigerator: Highest efficiency for small DT

## Example

A modern gas furnace can work at practically 100% efficiency, i.e., 100% of the heat from burning the gas is converted into heat for the home. Assume that a heat pump works at 50% of the efficiency of an ideal heat pump.

If electricity costs 3 times as much per kw-hr as gas, for what range of outside temperatures is it advantageous to use a heat pump?

Assume  $T_{\text{inside}} = 295 \text{ }^{\circ}\text{K}$ .

## Solution

Find T for which  $e = 3$  for heat pump.

Above this T: use a heat pump

Below this T: use gas

heat pump :

$$e < \frac{1}{1 - T_{cold} / T_{hot}}$$

$$e = 3 = 0.5 \cdot \frac{1}{1 - T / 295}$$

50% of ideal heat pump

$$T = 295 \frac{5}{6} = 245.8^{\circ}\text{K} = -27^{\circ}\text{C}$$
