# HTML

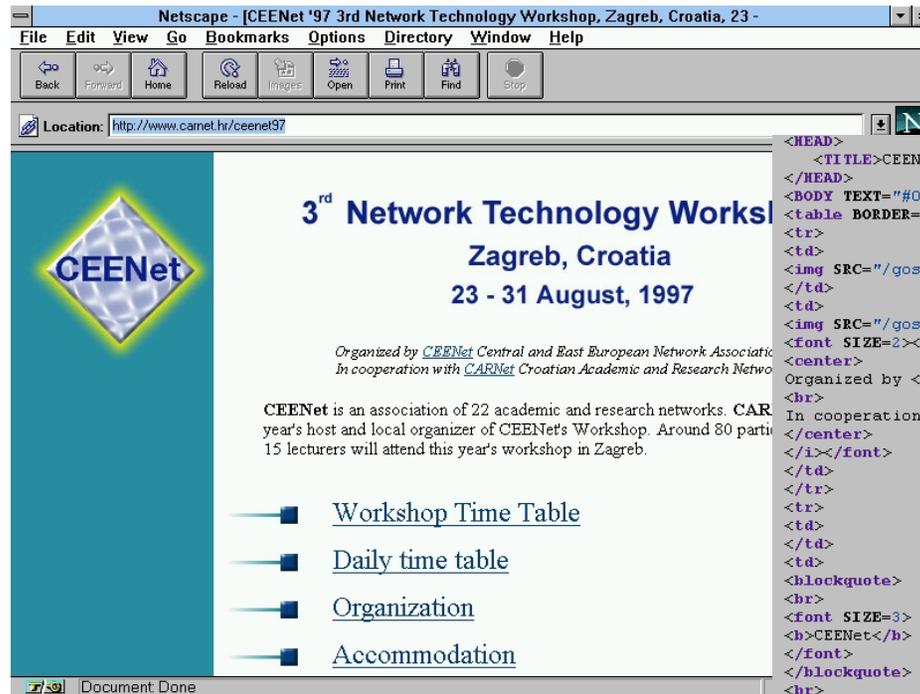

# HTML : Introduction

- ▶ HTML is a language for describing web pages.
- ▶ HTML stands for **H**yper **T**ext **M**arkup Language
- ▶ HTML is not a programming language, it is a **markup language**
- ▶ A markup language is a set of **markup tags**
- ▶ HTML uses **markup tags** to describe web pages

# HTML document

- ▶ HTML document contains markup tags  
`<H1> Example </H1>`
- ▶ tags are case insensitive  
`<H1>` or `<h1>`
- ▶ tag attributes may be case sensitive  
e.g. filenames
- ▶ tags are (usually) paired to denote the start and end of an element  
`<H1> Example </H1>`

# Advantages of HTML

- ▶ Easy to use
- ▶ Loose syntax (although, being too flexible will not comply with standards)
- ▶ Supported on almost every browser, if not all browsers.
- ▶ Widely used; established on almost every website, if not all websites.
- ▶ Very similar to XML syntax, which is increasingly used for data storage Free - You need not buy any software
- ▶ Easy to learn & code even for novice programmers

# Disadvantages of HTML

- ▶ It cannot produce dynamic output alone, since it is a static language
- ▶ Sometimes, the structuring of HTML documents is hard to grasp
- ▶ You have to keep up with deprecated tags, and make sure not to use them
- ▶ Deprecated tags appear because another language that works with HTML has replaced the original work of the tag; thus the other language needs to be learned (most of the time, it is CSS)
- ▶ Security features offered by HTML are limited
