

# Stress Analysis

Mechanics: Stress and strain

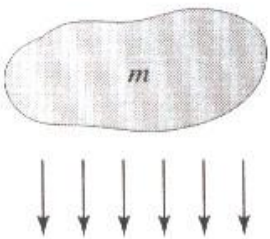

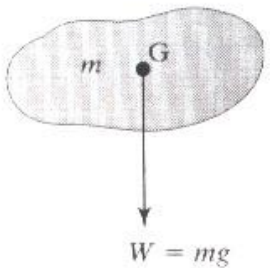

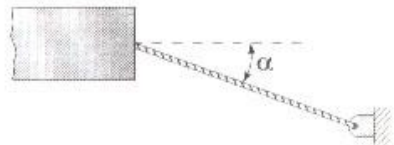

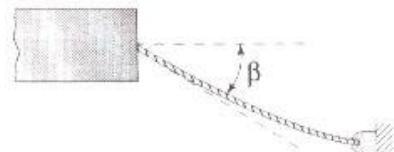

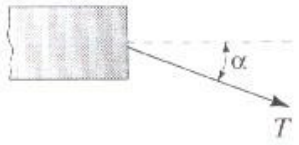

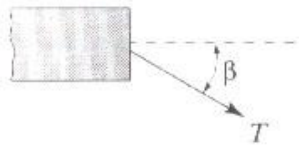

# Topics

- Free Body Diagrams (Review)
- Stress
- Strain
- Deformation
- Hooke's Law
- Stress-Strain Diagrams
- Design: The Safety Factor

# Free Body Diagrams

- Shows all external forces acting on the body
- Procedure
  1. Identify the isolated body and draw it
  2. At all force locations draw the vectors
    - a. Supports
    - b. Connections
    - c. Contacts
  3. Add the Weight force
  4. Label forces with their value or a letter for unknowns
  5. Add a coordinate system
  6. Add geometric data (Lengths, angles, ... )

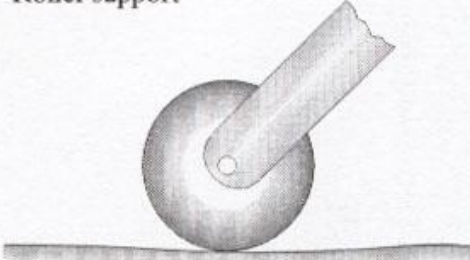

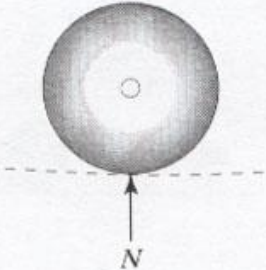

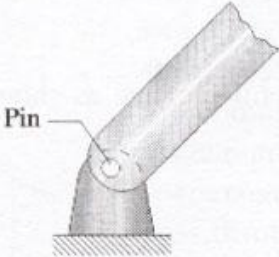

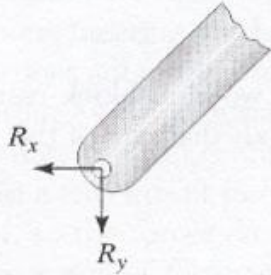

# Examples 1

<p>Gravitational force</p>  <p>A shaded, irregularly shaped mass labeled <math>m</math> is shown. Below it, seven vertical arrows point downwards, representing a distributed gravitational force.</p>	 <p>A shaded, irregularly shaped mass labeled <math>m</math> is shown. A point labeled <math>G</math> is marked inside the mass. A single vertical arrow points downwards from <math>G</math>, labeled <math>W = mg</math>.</p>	<p>The gravitational force acts through the center of gravity, <math>G</math>.</p>
<p>Cable force</p>  <p>A rectangular block is on the left. A cable is attached to it and extends to the right, where it is fixed to a wall. The cable is straight. A dashed horizontal line is drawn from the block. The angle between the dashed line and the cable is labeled <math>\alpha</math>.</p> <p>Weight of cable neglected</p>  <p>A rectangular block is on the left. A cable is attached to it and extends to the right, where it is fixed to a wall. The cable is curved downwards. A dashed horizontal line is drawn from the block. The angle between the dashed line and the cable at the fixed end is labeled <math>\beta</math>.</p> <p>Weight of cable included</p>	 <p>A rectangular block is on the left. A cable is attached to it and extends to the right, where it is fixed to a wall. The cable is straight. A dashed horizontal line is drawn from the block. The angle between the dashed line and the cable is labeled <math>\alpha</math>. A vector labeled <math>T</math> points along the cable to the right.</p>  <p>A rectangular block is on the left. A cable is attached to it and extends to the right, where it is fixed to a wall. The cable is curved downwards. A dashed horizontal line is drawn from the block. The angle between the dashed line and the cable at the fixed end is labeled <math>\beta</math>. A vector labeled <math>T</math> points along the cable to the right.</p>	<p>The tension force, <math>T</math>, in a cable is always directed along the axis of the cable.</p>

# Examples 2

# Examples 3

Configuration	Free-body diagram	Comments
<p data-bbox="266 386 440 415">Roller support</p> 		<p data-bbox="1267 419 1624 536">A roller supports a normal force but no friction force because a friction force would cause the roller to rotate.</p>
<p data-bbox="266 836 446 865">Pin connection</p> 		<p data-bbox="1267 893 1702 1051">A pin connection can support a reaction force in any direction in the plane normal to the pin's axis. This force may be resolved into its x and y components, <math>R_x</math> and <math>R_y</math>.</p>

# Stress

- Internal Forces
  - Reaction to external forces
  - Distributed throughout volume of material
- Stress
  - Normal stress
    - Acts at right angles to a selected plane
    - The axial direction in a rod or cable
  - Shear stress: stays in the selected plane  
(advanced topic: Strength of materials course)
  - **Can a structure withstand the forces applied to it?**

# Stress 2

$$\sigma = P/A \text{ (Pascals)}$$

$\sigma$ : Average stress

$P$ : Applied force

$A$ : Cross section area

Tension / Compression

# Strain

- Strain: deformation due to stress

$$\varepsilon = \delta / L$$

$\varepsilon$ : Normal strain

$\delta$ : Change in length

$L$ : Original (unstressed) length

# Hooke's Law

- Springs

$$F = kx$$

F: Applied Force

k: Spring constant

x: displacement

- Stress-Strain

$$\sigma = E\varepsilon$$

$\sigma$ : Stress

E: Modulus of Elasticity

$\varepsilon$  : Strain

- Using

$$\sigma = P / A \text{ and}$$

$$\varepsilon = \delta / L$$

$$\delta = \frac{P * L}{A * E}$$

# Stress-Strain Diagram

# Example 6

- 200 kg engine block
- Cables
  - 0.7 m long
  - 4 mm diameter
  - $E = 200 \text{ GPa}$
- Find
  - Normal Stress
  - Axial Deformation

$$F = 200 \text{ kg} * 9.8 \text{ m/sec}^2$$

$$F = 1960 \text{ newtons}$$
