

Active Server Pages (ASP)

Outline

- 11.1 Introduction
- 11.2 How Active Server Pages Work
- 11.3 Client-side Scripting versus Server-side Scripting
- 11.4 Using Personal Web Server or Internet Information Server
- 11.5 A Simple ASP Example
- 11.6 Server-side ActiveX Components
- 11.7 File System Objects
- 11.8 Session Tracking and Cookies
- 11.9 Accessing a Database from an Active Server Page
- 11.10 Case Study: A Product Catalog

11.1 Introduction

- *Active Server Pages (ASP)*
 - Processed in response to client request
 - ASP file contains HTML and scripting code
 - VBScript de facto language for ASP scripting
 - Other languages can be used
 - JavaScript
 - **.asp** file extension
 - Microsoft-developed technology
 - Send dynamic Web content
 - HTML
 - DHTML
 - ActiveX controls
 - Client-side scripts
 - Java applets

11.2 How Active Server Pages Work

- Client sends request
 - Server receives request and directs it to ASP
 - ASP processes, then returns result to client
- HTTP request types
 - Request methods
 - **GET**
 - Gets (retrieves) information from server
 - Retrieve HTML document or image
 - **POST**
 - Posts (sends) data to server
 - Send info from HTML form
 - » Client-entered data
 - » Info to search Internet
 - » Query for a database
 - » Authentication info

11.2 How Active Server Pages Work (II)

- Browsers often cache Web pages
 - *Cache*: save on disk
 - Typically do not cache **POST** response
 - Next **POST** request may not return same result
- Client requests ASP file
 - Parsed (top to bottom) by ActiveX component **asp.dll**
 - *ActiveX component*: server-side ActiveX control that usually does not have GUI
 - Code executed as encountered
 - **@LANGUAGE** statement
 - Specifies scripting language
 - If not used, VBScript assumed
 - As interpreted, HTML (plus client-side scripts) sent to client
 - Parsed each time requested
 - Web server must support ASP by providing component such as **asp.dll**

11.3 Client-side Scripting versus Server-side Scripting

- Client-side scripting
 - Used for:
 - Validation
 - Interactivity
 - Enhancing Web page with ActiveX controls
 - Dynamic HTML
 - Java applets
 - Accessing browser
 - Browser-dependent
 - Scripting language must be supported by browser or scripting host
 - Viewable on client
 - Protecting source code difficult

11.3 Client-side Scripting versus Server-side Scripting (II)

- Server-side scripting
 - Reside on server → more flexibility
 - Database access
 - Usually generate custom response for client
 - Access to ActiveX server components
 - Extend scripting language functionality
 - Run exclusively on server → cross-platform issues not a concern
 - Not visible to client
 - Only HTML + client-side scripts sent to client

11.4 Using Personal Web Server or Internet Information Server

- Create subdirectories in root
 - **Deitel_Iw3http**
 - Copy all **.asp** files
 - **includes**
 - Copy all **.inc** files
 - **images**
 - Copy all **.gif** files
 - May have to change paths in **.asp** files to reflect directories

11.5 A Simple ASP Example

- Scripting delimiters
 - `<% and %>`
 - Indicate code is to be executed on server, not client
- **@LANGUAGE**
 - Specify scripting language (default VBScript)
 - `<% @LANGUAGE = "VBScript" %>`
- Each time page refreshed, server loads and interprets ASP

```

1<% @LANGUAGE = VBScript %>
2<% Option Explicit %>
3<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.0 Transitional//EN">
4<% ' Fig. 11.1 : clock.asp %>
5
6<HTML>
7<HEAD>
8<TITLE>A Simple ASP Example</TITLE>
9<META HTTP-EQUIV = "REFRESH" CONTENT = "60; URL = CLOCK.ASP">
10</HEAD>
11<BODY>
12
13<FONT FACE = ARIAL SIZE = 4><STRONG>Simple ASP Example</STRONG>
14</FONT><P>
15     <TABLE BORDER = "6">
16     <TR>
17     <TD BGCOLOR = "#000000">
18         <FONT FACE = Arial COLOR = "#00FF00" SIZE = 4>
19             <% =Time() %>
20         </FONT>
21     </TD>
22     </TR>
23     </TABLE>
24</BODY>
25</HTML>

```

1.1 Specify VBScript as scripting language

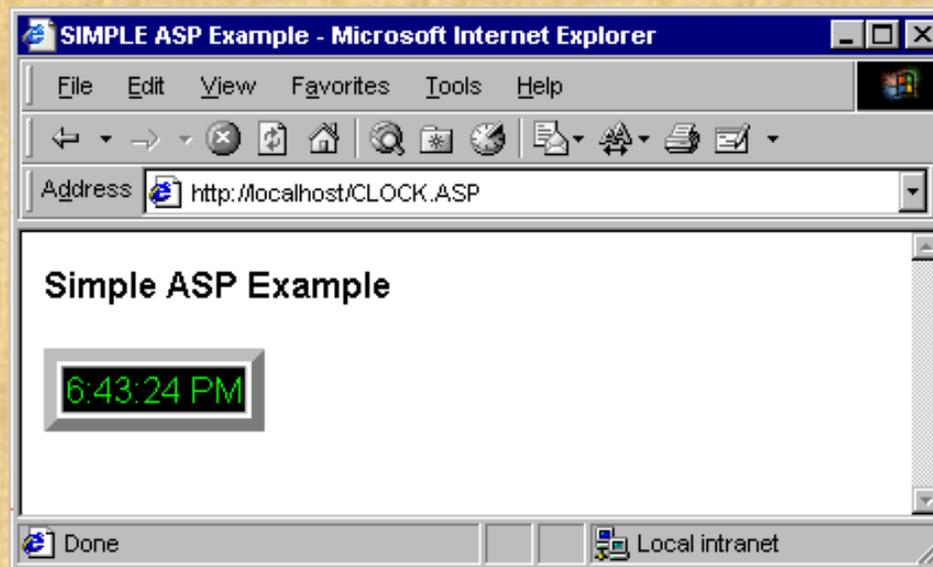

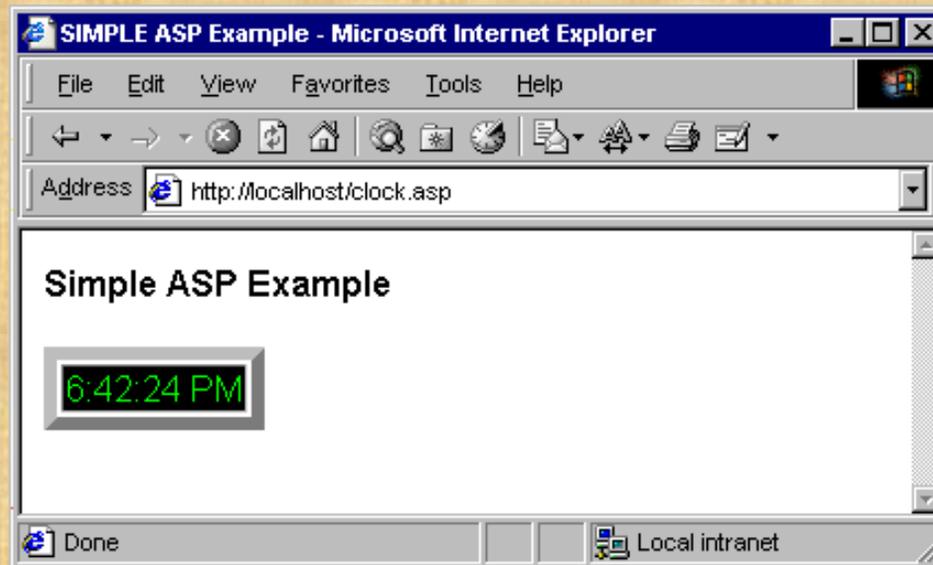

1.2 Use Option Explicit to indicate variables be explicitly declared by programmer

1.3 Use META tag to set refresh interval

Time gets current time on server (hh:mm:ss)

Short for <% Call Response.Write(Time()) %>

Output from a simple Active Server Page

11.6 Server-side ActiveX Components

- Server-side ActiveX components
 - Typically do not have GUI
 - If scripting language for ASP not support certain feature, create ActiveX Server component
 - Visual C++, Visual Basic, Delphi, etc.
 - Usually execute faster than scripting language equivalents
 - Executed on server
 - Client does not need to support ActiveX technologies

Some server-side ActiveX components included with IIS and PWS

Component Name	Description
MSWC.BrowserType	ActiveX component for gathering information (e.g., type, version, etc.) about the client's browser.
MSWC.AdRotator	ActiveX component for rotating advertisements on a Web Page.
MSWC.NextLink	ActiveX component for linking together Web pages.
MSWC.ContentRotator	ActiveX component for rotating HTML content on a Web page.
MSWC.PageCounter	ActiveX component for storing the number of times a Web page has been requested.
MSWC.Counters	ActiveX components that provides general-purpose persistent counters.
MSWC.MyInfo	ActiveX component that provides information (e.g., owner name, owner address, etc.) about a Web site.
Scripting.FileSystemObject	ActiveX component that provide an object library for accessing files on the server or on the server's network.
ActiveX Data Objects (ADO) Data Access Components	ActiveX components that provide an object library for accessing databases.

```

1<% @LANGUAGE = VBScript %>
2<% Option Explicit %>

Percentage of time image appears

Demonstrating the AdRotator ActiveX component

11.7 File System Objects

- File System Objects (FSOs)
 - Manipulate files, directories and drives
 - Read and write text
 - In Microsoft Scripting Runtime Library
 - 5 FSO types:
 - **FileSystemObject**
 - Interact with **Files**, **Folders** and **Drives**
 - **File**
 - Manipulate **Files** of any type
 - **Folder**
 - Manipulate **Folders** (i.e, directories)
 - **Drive**
 - Gather info about **Drives** (local or remote)
 - **TextStream**
 - Read and write text files

11.7 File System Objects

- `OpenTextFile(filename, code, create)`
 - `filename` - file to open
 - `code`
 - 8 - open for appending
 - 1 - open for reading
 - 2 - open for writing
 - `create?` - if `true`, creates a new file if does not exist

FileSystemObject methods

Methods	Description
CopyFile	Copies an existing File .
CopyFolder	Copies an existing Folder .
CreateFolder	Creates and returns a Folder .
CreateTextFile	Creates and returns a text File .
DeleteFile	Deletes a File .
DeleteFolder	Deletes a Folder .
DriveExists	Tests whether or not a Drive exists.
FileExists	Tests whether or not a File exists. Returns boolean.
FolderExists	Tests whether or not a Folder exists. Returns boolean.
GetAbsolutePathName	Returns the absolute path as a string.
GetDrive	Returns the specified Drive .
GetDriveName	Returns the Drive drive name.
GetFile	Returns the specified File .
GetFileName	Returns the File file name.
GetFolder	Returns the specified Folder .
GetParentFolderName	Returns a string representing the parent folder name.
GetTempName	Creates and returns a string representing a file name.
MoveFile	Moves a File .
MoveFolder	Moves a Folder .
OpenTextFile	Opens an existing text File . Returns a TextStream .

Some common File properties and methods

Property/method	Description
<i>Properties</i>	
DateCreated	Date. The date the File was created.
DateLastAccessed	Date. The date the File was last accessed.
DateLastModified	Date. The date the File was last modified.
Drive	Drive. The Drive where the file is located.
Name	String. The File name.
ParentFolder	String. The File 's parent folder name.
Path	String. The File 's path.
ShortName	String. The File 's name expressed as a short name.
Size	The size of the File in bytes.
<i>Methods</i>	
Copy	Copy the File . Same as CopyFile of FileSystemObject .
Delete	Delete the File . Same as DeleteFile of FileSystemObject .
Move	Move the File . Same as MoveFile of FileSystemObject .
OpenAsTextStream	Opens an existing File as a text File . Returns TextStream .

Some Folder properties and methods

Property/method	Description
<i>Properties</i>	
Attributes	Integer. Value indicating Folder 's attributes (read only, hidden, etc.)
DateCreated	Date. The date the folder was created.
DateLastAccessed	Date. The date the folder was last accessed.
DateLastModified	Date. The date the folder was last modified.
Drive	Drive. The Drive where the folder is located.
IsRootFolder	Boolean. Indicates whether or not a Folder is the root folder.
Name	String. The Folder 's name.
ParentFolder	String. The Folder 's parent folder name.
Path	String. The Folder 's path.
ShortName	String. The Folder 's name expressed as a short name.
ShortPath	String. The Folder 's path expressed as a short path.
Size	Variant. The total size in bytes of all subfolders and files.
Type	String. The Folder type.
<i>Methods</i>	
Delete	Delete the Folder . Same as DeleteFolder of FileSystemObject .
Move	Move the Folder . Same as MoveFolder of FileSystemObject .
Copy	Copy the Folder . Same as CopyFolder of FileSystemObject .

Drive properties

Property	Description
AvailableSpace	Variant. The amount of available Drive space in bytes.
DriveLetter	String. The letter assigned the Drive (e.g., "C").
DriveType	Integer. The Drive type. Constants Unknown , Removable , Fixed , Remote , CDRom and RamDisk represent Drive types and have the values 0–5, respectively.
FileSystem	String. The file system Drive description (FAT, FAT32, NTFS, etc.).
FreeSpace	Variant. Same as AvailableSpace .
IsReady	Boolean. Indicates whether or not a Drive is ready for use.
Path	String. The Drive 's path.
RootFolder	Folder. The Drive 's root Folder .
SerialNumber	Long. The Drive serial number.
TotalSize	Variant. The total Drive size in bytes.
VolumeName	String. The Drive volume name.

11.8 Session Tracking and Cookies

- Customized services
 - <http://my.yahoo.com/>
 - Shopping cart
 - Marketing
- Track clients
 - *Session tracking*
 - Handled by server
 - ASP: **Session** object
 - **Timeout** property
 - » Default: 20 minutes
 - » Terminate with **Abandon** method

11.8 Session Tracking and Cookies (II)

- *Cookies*
 - Small files sent as part of response to client
 - Every HTTP interaction between client and server includes *header*
 - Contains info about request or response
 - Request: type of request (**GET** or **POST**) and cookies stored on client machine
 - Maximum age
 - Duration of browsing session
 - Store cookies on client computer for future use
 - Cookies automatically deleted when expire

11.8 Session Tracking and Cookies (III)

- *ASP application*
 - Multiple ASP pages linked through **POST** requests
- Server side include (SSI)
 - SSI statement replaced with contents of file
 - SSI statements always execute before any scripting code
 - **.inc** extension
- Virtual paths vs. physical paths

Creating Web pages using an Active Server

The screenshot shows a Microsoft Internet Explorer browser window titled "Instant Page Content Builder - Microsoft Internet Explorer". The address bar displays "http://localhost/instantpage.asp". The page content includes a logo for "Mother Goose Translations" featuring a yellow star and a blue goose. Below the logo is the heading "Instant Page Content Builder". The form contains four input fields: "Your Name:" (empty), "Enter the Filename:" (containing "YourFileName.asp"), "Enter the Title:" (containing "Document Title"), and "Enter the Content:" (containing "Replace this text with the information you would like to post."). There are "SUBMIT" and "CLEAR" buttons below the content field. At the bottom, there is a link for "Ordering Information - Contact the Editor". The status bar at the bottom shows "Done" and "Local intranet".

1.1 Build header and assign HTML to string header

1.2 Build footer using different method and assign HTML to string footer

```

109 footer = footer & "</HTML>" & vbCrLf
110
111 ' Creates a FileSystem Object
112 Set fso = Server.CreateObject( "Scripting.FileSystemObject" )
113
114 ' Directory must be open for write by all!
115 ' directoryPath must be modified to reflect the file structure
116 ' of the server
117 directoryPath = "c:\webshare\wwwroot\temp\"
118
119 'check to make sure that the filename is not empty
120 If Request( "filename" ) = "YourFileName.asp" Then
121     Session( "filenamestring" ) = _
122         "<FONT COLOR=" & Chr( 34 ) & "red" _
123         & Chr( 34 ) & "SIZE=4>" _
124         & "Please enter a unique filename.</FONT>"
125     Call Response.Redirect( "instantpage.asp" )
126 End If
127
128 ' Builds path for text file
129 filePathname = directoryPath & Request( "filename" )
130
131 ' See if the directory exists
132 If fso.FolderExists( directoryPath ) <> True Then
133     Call fso.CreateFolder( directoryPath )
134 End If
135
136 ' Check if the filename already exists
137 If fso.FileExists( filePathname ) = True Then
138     Session( "filenamestring" ) = "<FONT COLOR=" _
139         & Chr( 34 ) & "red" & Chr( 34 ) & "SIZE=" _
140         & Chr( 34 ) & "4" & Chr( 34 ) & ">" _

```

1.3 Create FSO object

1.4 Validate contents of text box “Enter the Filename”

1.5 Use Response method Redirect to redirect browser

1.6 Preserve state with session variable filenamestring

1.7 Check to see if file name is unique

```

141         & "That filename is being used." _
142         & "Please enter a unique filename.</FONT>"
143     Call Response.Redirect( "instantpage.asp" )
144 End If
145
146 ' If fileNameString does not get set by an error,
147 ' give it a friendly value so that
148 ' when the user repeats the process,
149 ' fileNameString is initialized
150 Session( "filenamestring" ) = "<FONT COLOR=" _
151     & Chr( 34 ) & "blue" & Chr( 34 ) & "SIZE =" _
152     & Chr( 34 ) & "4" & Chr( 34 ) & ">" _
153     & "Welcome Back " & Request( "name" ) & "!</FONT>"
154
155 ' Create the html file
156 Set tso = fso.CreateTextFile( filePathName, False )
157 Call tso.WriteLine( header )
158 Call tso.WriteLine( Request( "content" ) )
159 Call tso.WriteLine( footer )
160 Call tso.Close
161
162 ' Create the results page
163 %>
164 <!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.0 Transitional//EN">
165 <HTML>
166 <HEAD>

11.9 Accessing a Database from an Active Server Page

- ASP can communicate with databases
 - Via ADO (ActiveX Data Objects)
- *Three-tier distributed applications*
 - User interface
 - Often created using HTML, Dynamic HTML or XML
 - Business logic
 - Use Web servers
 - Database access
 - All three tiers may reside on separate computers connected to a network

```

Browser displaying titles.asp

The screenshot shows a Microsoft Internet Explorer browser window. The title bar reads "Textbook Information Center: Titles - Microsoft Internet Explorer". The address bar contains "http://localhost/catalog/titles.asp?techid=4". The main content area features the Deitel & Associates Inc. logo on the left and a green banner for "JAVA™ TRAINING" on the right. Below the banner, the text reads: "Java™, C, C++, Visual Basic®, Object Technology and Internet Training", "Low Cost, High Quality On-Site and Public Seminars", "deitel@deitel.com 978.579.9911 (Fax) 978.579.9955", and "490B Boston Post Road, Suite 200 Sudbury, MA 01776". A red heading says "Welcome to the Textbook Information Center". Below it, a green box contains the text "Select a title from the list below:" followed by a bulleted list: "Java : How to Program, Edition 2" and "Java : How to Program, Edition 3". At the bottom, there is a link "Back to the Technology List" and a footer with contact information and a copyright notice: "© Copyright 1995-1999 by Deitel & Associates, Inc. All Rights Reserved. Thursday, September 09, 1999 08:59". The status bar at the bottom right shows "Local intranet".
